Getting Started

Instance Configuration

Jenkins URL:

The Jenkins URL is used to provide the root URL for absolute links to various Jenkins resources. That means this value is required for proper operation of many Jenkins features including email notification, PR status updates, and the BUILD_ URL environment variable provided to build steps.

The proposed default value shown is not saved yet and is generated from the current request, if possible. The best practice is to set this value to the URL that users are expected to use. This will avoid confusion when sharing or viewing links.

The Build Pipeline plugin

Using Jenkins and the build pipeline makes us realise the complexities of managing Jenkins over time. It is easier to use the *Build Pipeline* plugin in Jenkins to create pipelines with upstream and downstream projects (Figure 6).

Execute the pipeline as shown in Figure 7.

Scripted pipelines

Jenkins 2.0 and later versions have built-in support for delivery pipelines. *Jenkinsfile* contains the script to automate

application life cycle management activities. There are two types of pipelines in Jenkins, as of today. This means that *Jenkinsfile* can contain two different types of styles/syntax and yet it can achieve the same thing.

Scripted pipelines follow the imperative programming model. They are written in the Groovy script in Jenkins. All Groovy blocks/constructs help to manage flow as well as error reporting.

```
node {
    /* Stages and Steps */
}
```

```
node {
    stage('SCA') {
        // steps
    }
    stage('CI') {
        // steps
    }
    stage('CD') {
        // steps
    }
}
```
