

```

    }
  }
  stage('CI') {
    steps {
      //
    }
  }
  stage('CD') {
    steps {
      //
    }
  }
}

```

Blue Ocean

Blue Ocean provides an easy way to create a declarative pipeline using new user experiences available in its dashboard. It is like creating a script by selecting components, steps or tasks.

Open the Blue Ocean dashboard and click on *Create Pipeline*. Connect with the required repository; then create stages, select the steps and configure.

Blue Ocean is a new user experience, and it provides an easy way to access unit test results (Figure 10).

Click on *Pipeline* to get the status of the pipeline. Click on the specific stages to access the logs of these stages.

Click on *Artifacts* to access the package file and other artifacts (Figure 12).

The following list of open source tools can be integrated in the pipeline to implement DevOps practices.
