

Figure 1: RCloud on GitHub

- team mates. Figure 1 describes the RCloud components on GitHub.
- RCloud provides a platform for the data scientist to search relevant things without reinventing the wheel.
 - It provides fast interaction with data in the Hadoop Distributed File System (HDFS) or similar kinds of distributed file systems. This feature is very well suited to Big Data analytics.
 - RCloud differs from other DevOps of data science as it provides browser based access.
 - It gives a lot of flexibility to users to create any type of complex widgets, notebooks or dashboards.
 - Both registered and non-registered users can view or interact with live notebooks of the RCloud environment.
 - Communication in RCloud is done with standard communication protocols such as HTTP.
 - RCloud provides data scientists with the capability to run Big Data packages without writing complex code.
 - RCloud is well suited for Big Data applications due to its scalability feature.
 - It provides great security features so that unauthorised clients cannot make calls to the RCloud runtime environment. Notebooks of RCloud can also be encrypted for advanced security. Authenticated client server channelling is also a unique feature of RCloud.
 - RCloud maintains automatic Git based trials of code modifications. DevOps involves infrastructure, configuration management, integration, testing and monitoring. RCloud is considered as DevOps for data science as it resolves the data analysis development to deployment issues of ADSR. In this article, we have described the main features of RCloud in detail, with an emphasis on those that are very essential for data scientists. **END** 🐧
