

DevOps vs Agile: What You Should Know About Both

DevOps is a practice of bringing the development and operations teams together, whereas agile is an iterative approach that focuses on collaboration, customer feedback and small rapid releases. This article highlights the differences between the two software development technologies.

DevOps is a software development method that focuses on communication, integration and collaboration among IT professionals to enable rapid deployment of products. On the other hand, the agile methodology involves continuous iteration of development and testing in the SDLC process. In this software development method, the

emphasis is on iterative, incremental and evolutionary development.

Key differences

- DevOps is a practice of bringing the development and operations teams together, whereas agile is an iterative approach that focuses on collaboration, customer feedback and small rapid releases.
- DevOps focuses on constant testing and delivery while the agile process focuses on constant changes.
- DevOps requires a relatively large team while agile requires a small team.
- DevOps leverages both shift-left and shift-right principles; on the other hand, agile leverages the shift-left principle.
