

DevOps based free and open source tools

DevOps provides a large variety of tools that are useful in the automation of the software development, testing and release processes. Table 1 lists some of these tools.

Gulp: An open source tool for Web applications

Gulp is used by software development teams as the streaming build system with which a number of tasks can be programmed and automated in an effective way.

Gulp is an effective task runner that has the strong base of the Node.js platform. It makes use of powerful JavaScript code for the execution of tasks and corporate level Web applications.

In Web development projects, the following are a few of the tasks required to be worked on continuously by the software development teams:

- Formation, generation and transformation of templates
- Compression of multimedia files
- Code linting
- Code validation
- Integration of stylesheets and

Table 1: Prominent DevOps tools

Tool	URL
Gulp	https://gulpjs.com
Worksoft	https://www.worksoft.com
Kamatera	https://www.kamatera.com
Buddy	https://buddy.works
Nagios	https://www.nagios.org
Chef	https://chef.io
Jenkins	https://www.jenkins.io
Vagrant	https://www.vagrantup.com
Splunk	https://www.splunk.com
Git	https://git-scm.com/
Puppet	https://puppet.com

JavaScript code

- Code generation for cross-browser compatibility
- Deployment of files for staging and uploading to servers

Often, these tasks are repetitive in nature and require a lot of time. Gulp is a powerful and multi-featured tool that can be used to automate and speed up the tasks associated with software project development.

Installing and working with Gulp

To install and work with Gulp, you need to install Node.js. Once Node.js is installed, Gulp can be integrated with the following instruction:

```
$ npm install --global gulp
```

Once the installation is finished, the installed version can be verified as follows:

```
$ gulp -v
```
