

Key highlights

- *Activity:* Low but actively updated on GitHub
- *Type of ledger:* Private
- *Pricing:* Open source
- *Supported language:* Python
- *GitHub Repo:* Hydrachain (Python)

Corda

Corda is an open source blockchain platform that enables businesses to transact directly and in strict privacy using smart contracts, reducing transactions and record-keeping costs while streamlining business operations. In a world of permissionless blockchain platforms, in which all data is shared with all parties, Corda's strict privacy model allows businesses to transact securely and seamlessly, as shown in Figure 6.

R3 delivers two interoperable and fully compatible distributions of the platform – Corda, a free download based on the code available on GitHub; and Corda Enterprise, an enterprise blockchain platform that offers features and services fine-tuned for modern-day businesses.

Corda provides three main tools to achieve global distributed consensus:

- Smart contract logic, which specifies constraints that ensure state transitions are valid according to pre-agreed rules, described in the contract code as part of CorDapps.
- Uniqueness and timestamping services known as notary pools to order transactions temporally and eliminate conflicts.
- A unique component called the flow framework, which simplifies the process of writing complex multi-step protocols between multiple mutually distrusting parties across the Internet.

MultiChain

MultiChain technology is a platform that helps users to establish a certain private blockchain that can be used by organisations for financial transactions. A simple API and a command-line interface are what MultiChain provides us. This helps to preserve and set up the chain.

MultiChain is for creating new blockchains with their own native currencies and/or issued assets. Users cannot transact existing cryptocurrencies on MultiChain unless someone trusted acts as a bridge in the middle, holding some cryptocurrency and issuing tokens on MultiChain to represent it as shown in Figure 7.

MultiChain is an off-the-shelf platform for the creation and deployment of private
