

performance. We welcome developers to discover the great performance Scylla offers out of the box, at a reasonable price and without lock-in.”

The company said that Scylla delivers better, more consistent performance

along with a significant reduction in the total cost of ownership (TCO) and greater deployment flexibility. The production-ready features in Scylla Open Source 4.0 offer certain advantages over Cassandra. As per the company, these include

scaling up to any number of cores, streaming data to 60TB mega nodes, built-in schedulers, unified cache, and self-tuning operations.

Linux Foundation launches ToIP Foundation to boost data privacy

Governments, non-profits, and the private sector, across the finance, health care and enterprise software domains have joined hands with the Linux Foundation to improve universal security and privacy protocols for consumers and businesses in the digital era. The ToIP Foundation is being developed with global, pan-industry support from organisations with sector-specific expertise.

Businesses today are struggling to protect and manage digital assets and data. This happens especially in an increasingly complex enterprise environment that includes the Internet of Things (IoT), edge computing, artificial intelligence, etc. It results in reducing the already low consumer confidence in how companies use or

profit from users’ personal data, and is slowing innovation on opportunities like digital identity as well as the adoption of other new services.

The ToIP Foundation will use digital identity models that leverage interoperable digital wallets and credentials. It will also

use the new W3C Verifiable Credentials standard to address these challenges and help consumers, businesses and governments to better manage risk, improve digital trust, and protect all forms of identity online.

Jim Zemlin, executive director at the Linux Foundation said, “The ToIP Foundation promises to provide the digital trust layer that was missing in the original design of the Internet and to trigger a new era of human possibility. The combination of open standards and protocols, pan-industry collaboration, and our neutral governance structure will support this new category of digital identity and verifiable data exchange.”

Researchers unveil AI-powered open source platform for COVID-19 vaccine development

A team of machine learning, immunology, and bioinformatics researchers have unveiled Eptopes.world. This is an AI-powered, open source and interactive Web platform to help accelerate vaccine development for COVID-19.

The team is led by Tariq Daouda, PhD, who is currently a post-doctoral researcher at Harvard Medical School. It consists of volunteers

Nvidia plans to acquire Cumulus Networks to boost networking software capabilities

Nvidia has announced its plans to acquire Cumulus Networks. The company said that this will help boost its networking software capabilities and launch a new era of the accelerated, software-defined data centre. Recently, Nvidia had completed its acquisition of Mellanox Technologies.

In a blog post, the company stated, “With Cumulus, Nvidia can innovate and optimise across the entire networking stack, from chips and systems to software including analytics like Cumulus NetQ, delivering great performance and value to customers. This open networking platform is extensible, and allows enterprise and cloud-scale data centres full control over their operations.”

Cumulus is based in Mountain View, California. It supports more than 100 hardware platforms with Cumulus Linux, its operating system for network switches. Nvidia said that its Nvidia Mellanox Spectrum switches already ship with Cumulus Linux and SONiC. This is the open source offering forged in Microsoft’s Azure cloud and managed by the Open Compute Project.

The ONIE environment Cumulus created is a software foundation for Mellanox’s bare metal switches. Nvidia added in the blog post, “Together, we built DENT, a distributed Linux software framework for retail and other enterprises at the edge of the network. And our Onyx operating system continues to expand, especially in Ethernet Storage Fabrics (ESF).”
