

you need to account for when deciding on whether to opt for a headless CMS. A traditional CMS covers your Web and mobile bases out-of-the-box with themes to customise the look and feel. To get started with content delivery on a headless CMS, developers will need to build a user experience (UX) for the content. This is also true for the content creators – a traditional CMS includes content creation and collaboration workflows which are non-existent with the other choice. A pure content management system will also be a culture shock to content authors since well-known concepts such as pages and other UI constructs do not exist at all, and a UX for authors will need to be built from scratch too.

So, is it a traditional CMS or a headless one?

Traditional CMSs have been around for a long time, with quite an

ecosystem having been built around them. For example, the popular CMS WordPress is estimated to have over a 60 per cent share of the overall CMS market and 35 per cent share of all websites functioning today. One of the reasons is the extensibility and the plugin marketplace this CMS offers to customise it from a simple blog to a full-fledged e-commerce website. With responsive themes and plugins, you can convert WordPress installations to PWAs and push them into the App Store and Play Store to provide a more engaged experience for the users. Drupal is another contender in this domain.

Headless CMSs are a newer breed in the content management space, and they do tick all the boxes for building scalable and extensible content delivery pipelines that can support virtually any kind of device available today and tomorrow. The user experience, though,

needs to be built before you can realise the value they bring to the table.

Moving to a headless CMS may not be a straightforward activity and will require planning and effort to transition your workflows and users seamlessly. Before you start planning on this, take a step back and see if your existing CMS satisfies your current and future content delivery requirements. If you see yourself extending your CMS because it does not support certain delivery surfaces that either your business plans dictate you use or you believe your users are moving to, it is time to consider evaluating a headless CMS. **END** 🐧
