

“Blockchain needs to be a part of a larger network”

NITI Aayog's National Health Stack is a holistic platform that supports a multitude of health verticals and their disparate branches. **Vivek Mahendra**, *enterprise architect and chief platform officer, CallHealth*, and **Parag Jain**, *founder, ThynkBlynk*, talk about how blockchain technology will work in healthcare, in a conversation with **Ayushee Sharma**.

Parag Jain, founder,
ThynkBlynk

Q. How can data stored in the blockchain be utilised to achieve better healthcare solutions?

A. Blockchain creates copies of information in any format across a network or distributed ledger. Authenticity is maintained as information is electronically signed (e-signed) at the point of creation. This also enables tracking of changes, thus making information immutable.

Blockchain ensures that the user can keep personal data anywhere and transact with it, and the recipient can refer to the blockchain ID to verify that data.

Also, if the Medical Council of India (or the proposed National Medical Commission) publishes on the blockchain network that a doctor is certified to practice in India, CallHealth platform
