

and complete these tasks much faster.

There are quite a few AI-based platforms in the market today. According to a report by Forrester, by 2020, candidates applying to jobs at twenty per cent of the large global enterprises will interact with chatbots before recruiters.

Improving employee onboarding experience: Employee onboarding is the employee's first experience with an organisation, and it is the organisation's best opportunity to create an excellent first impression. Today, due to resource crunch and subjectivity associated with people, onboarding experience has become random and unstandardised. Using AI effectively can help a new employee navigate his or her way into an organisation seamlessly, and have an excellent onboarding experience.

Identifying customised training requirements for employees: Mostly, people become redundant within an organisation because they lack relevant skills. But if they can be trained in a timely fashion, the organisation can utilise existing staff, without having to retrench and hire new employees. AI can be used effectively to match existing talent with what is needed, and

identify the gaps in skillsets. It can also do a fitment of who is best trained on which required skill(s).

Managing resources: People-intensive businesses have a huge challenge of finding the right skilled people internally at the right time, and often end up hiring people at a higher cost, when an equally skilled person is available within the company. AI can help with this function and in a very time-effective manner, thus reducing the cost of hiring, training and keeping a skilled resource on the bench.

Identifying people who are looking out: Losing trained and experienced employees to competition is a huge loss to any organisation. AI can track employees' keystroke patterns, idle times and Internet-browsing patterns, and predict whether they are looking for newer opportunities.

Smarter and better people analytics: AI-enabled employee analytics provide necessary insights to ensure better employee experience. It ensures meaningful employee engagement, which makes employees happier and increases retention.

These are only a few core functions that AI can carry out immediately.

However, there still exists a degree of apprehension among the HR fraternity about totally embracing AI. AI today is not just efficient, it is also inexpensive. One word of caution, though; it is imperative that recruitment processes are reviewed and re-engineered to remove age-old practices and made well-suited for reaping maximum benefits out of AI.

Research from PwC shows that 63 per cent of companies are rethinking the whole role of their HR department in light of the impact AI will have on their business. Thanks to AI and robotic process automation (RPA), HR experts will now be able to focus on core areas, which cannot be done by any technology. AI can help build a high-performance HR team and, as a result, a high-performance workforce. **END**
