

A progressive Web app (PWA) is one that uses modern Web capabilities to deliver an app-like experience to users. It is built using common Web technologies like HTML, CSS and JavaScript, and is designed to work on any device that has a standards-compliant browser. PWAs are browser- and platform-agnostic.

Why Progressive Web Applications are so Popular Today

Momobills is an invoice maker and billing software based progressive mobile application (PWA) developed by Shreyas Software Private Limited. Grocery shop owners can use this software to send e-bills to customers who have just shopped without the hassle of any point of sale (POS) device. These e-bills can even be printed by thermal printers or POS terminals. The software also comes with integrated Bluetooth thermal print support.

This is just one example of a PWA, which is the latest trend in the Web application sector. Imagine a world in which everything is connected and communicates with the Web — PWAs will play a very significant role in such a world.

The gadget world is full of apps, some of which are excellent, covering aspects from gaming to news reading. Web applications are an integral part of the Web world, though they are sometimes neglected by developers. Apps have taken off in a big way and have already crossed a turnover of US\$ 6 trillion globally.

More than 50 per cent of Internet users have depended on mobiles for all their online activities since 2018. However, the slightest delay while downloading Web apps irks users. To resolve this issue, Google introduced PWAs in 2015.

PWAs are a blend of native apps and Web apps in the functions they provide. Google depends heavily on PWA development for its services like weather reports, restaurant reviews

and locations, traffic conditions, and the scores of sports events. Aliexpress, Alibaba's consumer shopping platform, found considerable increase in its performance once it began using a PWA.

PWAs are changing the look of native apps. More importantly, Microsoft (Edge), Apple (Safari) and last but not least, Google (Chrome), all provide ongoing maintenance to PWAs. Directories like *Outweb.io* and PWA Rocks offer a collection of PWAs in one place.

Today there are about 2 million apps in the Apple Store and almost double that in the Android store. Not all of these apps are downloaded and used, and your mobile certainly doesn't have the space for all of them. Many website owners tried to take advantage of this fact, and that led to the development of PWAs.

Introduced in 2015, progressive Web apps have gained popularity over the years. Google, Apple, Microsoft and other such technical giants are all slowly transitioning to PWAs because of the flexibility of these apps.
