

Boston Dynamics open sources code for Spot, its robot dog

Boston Dynamics has made the source code for its robot dog available. According to a report by HYPEBEAST, Boston Dynamics VP Michael Perry said that the release will allow developers to create custom applications that enable Spot to do useful tasks in different industries.

The report also said that access had been given to early adopters since a while. Developers have to join Boston Dynamics' early adopter programme to lease a robot. The company said this has been done to create custom methods of controlling the robot, and to integrate sensor information into data analysis tools. This will also help to design custom payloads, which will increase the capabilities of the base robot platform.

Boston Dynamics is also moving ahead with an initiative to commercialise its fleet of robots.

Boston Dynamics has worked with a company named HoloBuilders to demonstrate the functions Spot can take up. The company said that workers will be able to use a phone to teach Spot to document a path around a construction site. After that, Spot will autonomously navigate that path and take 360 images. This will go into their processing software right away.

Fugue open sources its security and compliance tool, Regula

Cloud infrastructure security and compliance solutions provider Fugue has made one of its tools called Regula open source. As per a press release from Jaxenter, Regula is a tool that evaluates Terraform Infrastructure-as-Code for security misconfigurations and compliance violations, before deployment. Fugue has made Regula available on the company's GitHub repo.

Regula rules are written in Rego, which is an open source policy language used by the Open Policy Agent project. It can be integrated into CI/CD pipelines to prevent cloud infrastructure deployments that may violate security and compliance practices.

The tool checks Terraform scripts before they deploy infrastructure. Before entry into the main pipeline, any potential security or compliance concerns are taken care of. The changes get passed onto the next stage if the check passes without issue. It can catch misconfigurations that may not have been flagged by the more common compliance standards.

Proton Technologies makes ProtonVPN open source

Proton Technologies has made its VPN tool, ProtonVPN, open source. The company said that it is not only releasing the source code but has also conducted an independent security audit.

ProtonVPN was created by CERN's scientists. A report by Betanews stated that Dr Andy Yen, founder and CEO of Proton Technology, said that VPN services can technically access very sensitive user data. For this reason, users should choose services that have a track record of transparency and security. He added that by publishing the code, the company hopes to demonstrate its commitment towards putting security above everything.
