

Sources at Proton added that a contributing factor in going open source was that such software is more trustworthy than proprietary software. This is because it can be independently scrutinised, and potential vulnerabilities can be quickly identified and resolved.

AVSystem releases updated open source version of Anjay 2.2.1

AVSystem has released an updated open source version of Anjay 2.2.1 on GitHub. According to sources at AVSystem, it will synchronise the open source version of Anjay with the commercial branch which has been in development since September 2018.

Anjay is a free and open source LwM2M SDK (software development kit). It helps vendors of Internet of Things (IoT) and machine-to-machine (M2M) equipment to implement support for the LwM2M protocol. The company said that Anjay can be easily incorporated into the firmware of a device to enable remote management over this protocol.

The big changes in this version compared to the previous open source version of Anjay (1.16) include redesigned data model APIs that are compatible with the current commercial version. The company claimed that this version has robust error handling code. It has been rewritten entirely and has more flexible Constrained Application Protocol (CoAP) implementation. According to the company, this version comes with the asynchronous processing register, updates, request bootstrap and confirmable notify messages – all without blocking other functionalities.

The commercial version of Anjay also provides support for LwM2M 1.1 features like Composite operations, send method, SenML JSON and CBOR data formats, TCP, SMS and NIDD bindings.

Google makes NLP model ALBERT open source

Google has made ALBERT (A Lite BERT) available in an open source version. This is a deep learning natural language processing (NLP) model. ALBERT uses fewer parameters than BERT, without compromising accuracy.
