Open source tools for IaaS monitoring

At the very least, IaaS can be monitored via scripts and alerts can be triggered. But this comes with a lot of effort and complications as well. There are many open source tools available for IaaS monitoring and many licence based tools available for enterprise support. We will discuss only the open source tools available.

Nagios Core

Nagios Core is one of the open source monitoring and alerting tools used to monitor servers. It has a rich set of APIs to integrate with many tools and hypervisors, making Nagios a very powerful tool in the IT infra world.

Using Nagios, we can monitor servers, multiple operating systems, network traffic, network status, etc. It has agent based and agentless monitoring features. Nagios has a

very strong community, which has contributed 5000+ add-ons, making it stronger than other tools.

- Using Nagios Core, you can monitor most of the IT infra resources and network services.
- There is the option to mute the alerts during scheduled maintenance.
- There is an option to send alerts via email/SMS or a predefined script.
- IT admins can acknowledge the alerts and they can be tracked.
- A powerful reporting dashboard provides historical events and alerts.
- Nagios Core provides a centralised dashboard for your entire IT operations, both on-premise and on the cloud.
- The capacity planning graphs help to proactively act on the infra upgrades.
- Multi-tenant capability provides good isolation across multiple clients or units.
