

FOSSID and BearingPoint team up to work on open source software governance

Open source software compliance and security solutions provider FOSSID has entered into a partnership with open source management services provider BearingPoint around free and open source software governance. The two have been cooperating in selected projects for more than two years. FOSSID will provide BearingPoint with open source analysis tools.

FOSSID says that it helps companies achieve maximum FOSS adoption efficiency by introducing tools that provide high levels of accuracy, performance, privacy and automation. Its code scanner uses one of the most comprehensive knowledge bases on the market, the company claims. Currently, it references some 78 million open source projects, 600 billion snippets, and 120,000 vulnerable projects.

Oskar Swirtun, CEO of FOSSID said, “We are proud to enter this strategic partnership with BearingPoint, and to be an integral part of their FOSS compliance and security successes. BearingPoint has once again proven that its management services are a great alternative to adding specialists to your head-count in multiple verticals.”

Health said, “In a time of crisis, it is crucial to be able to track your people and critical supplies in real-time, so they can be allocated efficiently and effectively to save lives and ease pressure on the system.”

The Traction Thrive Critical Care Resource Management app has three functions. It enables healthcare workers to specify which workers, ventilators and personal protective equipment they have. It also shows each facility’s current occupancy and resource capacity. The app also serves as a communication hub between healthcare providers within a site or across regions. It offers advanced reporting capabilities for hospitals and regional health leadership.

Mozilla launches COVID-19 Solutions Fund to support open source technology projects

Mozilla has announced the creation of a COVID-19 Solutions Fund as part of the Mozilla Open Source Support Programme (MOSS). It aims to provide awards of up to US\$ 50,000 each to open source technology projects working towards the COVID-19 pandemic in some way.

and software (say, a platform that connects hospitals with people who have 3D printers who can print parts for that open source ventilator). It will also accept software that can solve the secondary effects of COVID-19 (say, a browser plugin that combats COVID-19 related misinformation).

Mozilla sources have said that it is looking to fund reasonably mature projects that can immediately deploy its funding. The company added that early-stage ideas are unlikely to receive funding. Mozilla expects awardees to use all funds within three months of receiving the award. It will accept applications from anywhere in the world to the extent legally permitted. It will accept applications from any type of legal entity, including NGOs, for-profit hospitals, or a team of developers with strong ties to an affected community. Applications will be accepted and reviewed on a rolling basis.

It also said that the MOSS committee will only consider projects that are released publicly under either a free software licence according to the FSF or an open source licence according to the OSI. It will not accept projects that are not licensed for use under an open source licence.

Traction Thrive is customisable by healthcare providers and scalable without any new data centre. It is accessible from permanent and temporary facilities worldwide, and is portable across devices.

David Helliwell, co-founder and CEO of Thrive
