

How Digital Platforms are enabling a Data-Driven World

Digital platforms are creating a more global labour market by keeping virtual teams connected and giving them the flexibility to set their schedule. Such platforms make it easier for companies to find customers, monetise under-utilised assets and ease transactions.

Digital technologies provide opportunities for entrepreneurs and businessmen to create better experiences for their employees, customers and ecosystem partners. These help them achieve better performance, efficiency and revenue with low investments. Digital transformation involves two primary activities: building a digital platform and building a new operating model.

Digital platforms are online businesses that facilitate commercial interactions between at least two different groups, with one typically

being suppliers and the other consumers. MakeMyTrip, Amazon, Cars24, Swiggy, Facebook, Google, Ola, Upwork and Naukri are all digital platforms, but their business models are different from each other, and they interact with end-users and other businesses in different ways. Each platform has created different rules to optimise these interactions for a unique customer experience.

A digital platform includes a data-analytical engine, an artificial intelligence (AI) engine and a machine learning transactional engine to perform tasks or rule based

activities. It has APIs, or tools that allow digital platforms to talk to other software, and tools for monitoring regulatory compliance. The digital platform handles an end-to-end business process necessary to create better experiences for its users.

Metrics of digital platforms

Digital platforms have experienced significant growth in adoption due to several reasons, including increase in Internet adoption, maturation of the online advertising industry, rise in smartphone use and growth of cloud computing.
