

Machine Learning and Deep Learning:

A Perspective on the Future

Industry experts believe that advances in machine learning (ML) and deep learning (DL) algorithms will build new frontiers in AI. Since much of the world today depends on data, algorithms built around intensive data will play a major role. Lots of new developments in ML and DL based frameworks, like the latest releases of TensorFlow 2.0, Keras and Scikit-Learn, will help cope with the changes in this fast evolving domain.

The AI, ML and DL industry has been gaining lot of momentum of late. The latest developments in these fields are helping to solve many of industry's challenges and problems. One only needs to know what combination of these technologies to apply and how to apply them. This article helps in applying these techniques based on the domain or the origin of the application.

Many of these developments help in building and providing the following:

- Advanced patterns based on data
- Deeper business insight
- Faster detection of anomalies
- Faster and better feature engineering
- State-of-art feature selection
- Synthetic data sets for building new models
- Best-in-class recommender systems

Industries that can use AI, ML and DL

The energy sector: This is one of the key sectors driving every type of industry. Optimum and efficient usage of energy is of utmost importance.

Many industries have IoT systems for monitoring and control. And the IoT+AI combination is implemented in many industry sectors. For example, the best time to switch on certain lights in office premises or manufacturing

Industry sectors and applications of AI, ML and DL
