

the core concepts of this field such as supervised learning, unsupervised learning, support vector machines, kernel and neural networks. Students get to draw from numerous case studies and applications, and can go hands-on to apply the theoretical concepts to practice. By the end of the classes, you will have the confidence to apply your knowledge to real-life scenarios.

#### USPs

- Understand parametric and non-parametric algorithms, clustering and dimensionality reduction, among other important topics.
- Discover best practices and get advice from the instructor.
- Interact with your peers in a community of like-minded learners from all levels of experience.
- Real-world based case studies give you the opportunity to understand how problems are solved on a daily basis.

### 3. IBM AI Engineering Professional Certificate (Coursera)

If you want to be a part of the fast-paced field of AI, then this professional certification programme can open the right path for you. This programme consists of six different courses that will provide you with a practical understanding of machine learning and deep learning concepts. In this course, you will learn the fundamental concepts of ML and DL, with both supervised and unsupervised learning. This course is designed by an experienced faculty from IBM to help individuals cover every essential topic related to artificial intelligence. Only after finishing all the six courses will you receive a professional certificate in AI engineering.

#### USPs

- Learn how to use the popular ML and DL libraries like SciPy, ScikitLearn, PyTorch, etc.
- Learn how TensorFlow is applied to industry problems involving text analytics, object recognition, natural language processing and other types of classifiers.
- Dive into the individual concepts of ML with Python, an approachable and professional programming language.
- Obtain the skills to scale data science and ML tasks on Big Data sets using Apache Spark.
- Be able to build, train and deploy different types of deep architectures, as well as convolutional networks, recurrent networks and auto-encoders.

### 4. Artificial Intelligence: Business Strategies and Applications (Berkeley ExecEd)

This course is designed for senior leaders, managers and functional business heads who are interested in exploring AI opportunities across their business functions. This

programme will introduce you to the basic applications of AI, its capabilities and potential while offering in-depth information about automation, machine learning and robotics. It consists of eight different modules focused on various concepts, such as ML, AI strategy, key applications, neural networks, etc. At the end of the programme, a capstone project will be given to you to showcase what you have learned through the course. Completing the capstone project will make you eligible to receive the certificate of completion.

#### USPs

- Designed with a hands-on approach that will help you build a bridge between engineering and the technical aspects of AI with business applications.
- Learn how to organise and manage successful AI application projects while avoiding the pitfalls associated with these new technologies.
- Grasp the technical aspects of AI so that you can communicate effectively with technical teams and colleagues.
- Build your leadership credibility by obtaining a certificate of completion from the UC Berkeley Executive Education programme.
- Gain continuous support and assistance from the world-class faculty who will help you understand the critical concepts.

### 5. AI For Everyone by Andrew Ng (Coursera)

Artificial Intelligence is considered to be one of the more complex subjects in technology but its importance in our daily lives cannot be overstated. So, if you want your organisation to become better at using this technology, then this programme is worth a look. During classes, you will learn the meaning behind basic and crucial terminologies, what AI can and cannot do, spot opportunities to apply AI solutions to problems in your organisation, and more. By the end of the lectures, you will be proficient in the business aspects of AI and apply it aptly in relevant situations. The course is created by Andrew Ng, the pioneer in the field of artificial intelligence and the founder of Coursera.

#### USPs

- Understand what it is like to build machine learning and data science projects.
- Work with an AI team and build a strategy for your company.
- Navigate ethical and societal discussions relevant to this field.
- The lessons do not require any prerequisites; hence the course can be taken by anyone with any level of experience.
