

- The deadlines of the classes can be adjusted as per your convenience.

6. Artificial Intelligence Certification by Columbia University (edX)

Enrol in this certification to gain expertise in one of the fastest-growing areas of computer science through a series of lectures and assignments. The classes will help you to get a solid understanding of the guiding principles of artificial intelligence. With equal emphasis on theory and practical work, these lessons will teach you to deal with real-world problems and come up with suitable AI solutions. This certification will give you an edge at job interviews and open up other opportunities for you.

USPs

- The videos guide you through all the fundamental concepts, beginning from the basic topics to more advanced ones.
- Applies the concepts of machine learning to real-life challenges and applications.
- Thorough instructions are provided for configuring and navigating through the required software.
- Work on designing and harnessing the capabilities of the neural network.
- The classes are divided into four parts along with relevant examples and demonstrations.
- Apply the knowledge gained in these lectures in an array of fields such as robotics, computer vision and physical simulations.

7. An Introduction to Artificial Intelligence by IBM (Coursera)

This introductory course will guide you to the basics of artificial intelligence. With this course, you will learn what AI is and how it is used in the software or app development industry. During the course, you will be exposed to various issues and concerns that are relevant to AI like ethics, bias and jobs. After completing the course, you will also demonstrate AI in action with a mini project that is designed to test your knowledge of AI. After finishing the project, you will receive your certificate of completion from Udacity.

USPs

- Learn and understand concepts linked to AI, machine learning, deep learning and neural networks.
- No prior knowledge of programming or computer science is required to enrol in this course.
- Get advice from experts about learning AI better and

on how to start a career in this fast-evolving field.

- Become eligible to enter other classes and programmes like AI Foundations, and the IBM Applied AI professional certificate after finishing this course.
- A 100 per cent flexible course with no deadlines and the freedom to study at your own pace.

8. Microsoft Professional Certification in Artificial Intelligence (edX)

This programme focuses on helping you gain the skills needed to build deep learning predictive models for AI. While you are free to take the lessons in any order, it is advised you follow the suggested format so that you can develop your knowledge with gradually advanced concepts. After the completion of the first eight mandatory courses, you can choose from four options for the ninth one, prior to getting started with the capstone project.

USPs

- Learn to use Python to work with data.
- Understand the ethical practices in AI.
- Build ML and reinforcement learning models.
- Develop applied AI solutions and apply them.
- The programme is divided into nine courses along with tips, techniques and assessments.
- The final project gives you the chance to integrate the topics covered in the lectures and build optimal solutions.

9. TensorFlow for Artificial Intelligence by deeplearning.ai (Coursera)

If you are a software developer or have some prior experience with coding and are looking forward to building on those skills, then this certification is worth a look. These classes show you the techniques to implement the foundational principles of ML and DL using TensorFlow to build scalable models to solve real-world problems. By the end of this programme, you will have the practical skills to come up with scalable solutions for these problems as well as apply for relevant jobs.

USPs

- This course can be taken by anyone who has prior experience of Python.
- The instructor helps you to work with the fundamental features using examples.
- Students build a basic neural network and train it for a computer vision application.
- Understand how to use convolutions to improve your neural network.
- The training consists of tips and techniques along with assessments.
