

## The Best Machine Learning Certifications [2020]

### 1. Machine Learning Certification by Stanford University (Coursera)

This is one of the most sought-after certifications out there because it is taught by Andrew Ng, former head of Google Brain and Baidu AI Group. For a ML certification course to receive a rating of 4.9 out of 5 is no mean feat and the fact that it is associated with Stanford University simply adds much more credibility to the programme. The topics that are covered include supervised learning, unsupervised learning and best practices in machine learning. The programme structure is based on multiple case studies and applications to help you learn how to apply algorithms to build smart robots, text understanding, medical informatics, database mining and other areas.

#### USPs

- One of the best courses to begin learning the ML concepts and techniques used in daily work life.
- Get a broad introduction to ML, data mining and statistical pattern recognition with all the necessary topics.
- Learn some of the best practices in innovation that are inspired by Silicon Valley, pertaining to ML and AI.
- Learn to apply learning algorithms for developing smart robots, text understanding, computer vision, audio and other areas.
- Get access to multiple video lectures, guides, notes and practice exercises to boost your knowledge of ML.
- Earn a professional certificate that can testify your skills to employers.

### 2. Machine Learning: From Data to Decisions (MIT Professional Education)

Participants will gain a practical understanding of the tools and techniques used in machine learning applications. In the MIT tradition, you will learn by doing. There are no prerequisites in terms of math or computational science, although a basic understanding of statistics is helpful. This is not a coding course, but rather an introduction to the many ways that ML tools and techniques can help make better decisions in a variety of situations.

#### USPs

- On your journey through this course, you'll be in good company. Past participants come from a wide range of industries, job functions and management levels.
- This online programme approaches ML through the lens of practical applications. It is designed

specifically for professionals who want to develop a competitive edge by turning what is unknown into what's known — leading to better decisions and outcomes.

- Upon successful completion of the programme, MIT Professional Education grants a certificate of completion to participants.

### 3. Machine Learning with TensorFlow on Google Cloud Platform

With over 2.5 quintillion bytes of data being generated around the world on a daily basis, it is safe to say that data is power. Comprising five courses, this specialisation begins with an overview of the importance of ML, before moving to lectures about building ML models. The programme starts with introductory-level lessons that cover what ML is capable of and why it is so popular, followed by classes that focus on TensorFlow, an open source ML framework. These sets of lectures aim to help you to create, train, deploy ML models; solve numerical problems, and much more. There are also numerous hands-on opportunities to enhance the accuracy of ML using the various features available on the Google Cloud Platform.

#### USPs

- From an introduction, to machine learning concepts, to what kind of problems it can solve, you will learn everything with this course.
- Learn how to create distributed ML models that scale in TensorFlow, and how to scale out the training of those models.
- Learn how to integrate the right combination of parameters that harvest accurate, generalised models, and gain knowledge about the theory behind the practices.
- Boost your skills and improve your learning with hands-on labs available with the Google cloud platform.

### 4. Machine Learning Data Science Certification from Harvard University (edX)

This programme comprises nine courses that include machine learning, R, probability, linear regression and much more. This comprehensive programme is one of the best rated on the subject, online. You will also learn about inference and modelling, productivity tools and wrangling. This will be followed with a capstone project that you will create based on guidelines and have it assessed. The course is taken by Rafael Irizarry, professor of Biostatistics at Harvard University.
