

Developers can reach down to pull requests and observe the part of code that has been deleted or added. The application also incorporates syntax highlighting for the prevalent programming languages.

GitHub wrote the app independently for Android and iOS, using Kotlin for Android and Swift for iOS. An appearance and touch experience that is intrinsic to each platform has been favoured, instead of trying to develop a cross-platform UI or imitating the GitHub website. In an interview, Nystrom and GitHub designer Brian Lovin explained how they mocked up a design for one platform and had the team on the other platform replicate it with appropriate adjustments. The downside of the approach is that the app works differently from visiting the GitHub website with a mobile browser, which means there's more to learn.

Megvii to open source its deep learning framework MegEngine

AI based startup Megvii has announced that it will open source its deep learning framework, MegEngine. This will help global developers to create AI solutions for industrial and commercial purposes. It will also help create an ecosystem around Brain++, which is Megvii's new generation AI productivity platform.

MegEngine is one of the three primary components of Brain++ architecture. It was built to train computer vision algorithms at scale. The other two proprietary components of Brain++ include MegData and MegCompute.

MegEngine has been deployed across Megvii's three business units, which include personal IoT, city IoT, and supply chain IoT. The company said that MegEngine is especially effective for training on large volumes of images and videos, and completing complex tasks. This includes image classification, object detection, object/scene segmentation, and video analytics. MegEngine will be released under the terms of the Apache licence 2.0. The MegEngine code will be available on GitHub and OpenI.

Glue42 releases Glue42 Core platform

Glue42, which provides integrated desktop experiences to financial institutions, has released an open source platform called Glue42 Core. The solution is based on Glue42's interoperability platform Glue42 Enterprise. It allows companies to create UI and data integration between any type of application. The company has made the solution available to the financial services industry and to other sectors as well.

Rakuten joins Open Invention Network to speed up open source network technology

Japanese mobile network operator Rakuten has joined the Open Invention Network. It has done so to speed up research and development of open source mobile network technologies.

The Open Invention Network (OIN) works to provide freedom of action for its community members and users of Linux or open source software. The OIN has 3,100 members from the global telecom community.

A Rakuten spokesperson said in a statement that the company aims to contribute to OIN through collaboration with other members to promote rapid application development and further open source technology innovation. Rakuten already uses open source technology in its next-generation, fully virtualised, cloud-native mobile network, which was launched in October 2019.

Rakuten claims that by using open source technology in its network, it can streamline operations and reduce costs. It can also increase the flexibility of its network management process. The company is in the process of scaling up its 5G mobile network to cover all 47 prefectures in Japan.
