

Grafana: An Open Source Visualisation and Query Processing Platform for Data Scientists and Researchers

Grafana is an open source analytics and monitoring tool for all databases. It is widely used in industry to monitor a wide range of objects including infrastructure and applications. It can be used for the visualisation and plotting of data in various graphical formats.

The prolific use of smart gadgets and Internet connected devices has created a need to evaluate the resulting data sets. We require these data sets collected from multiple channels for effective and high performance knowledge discovery and predictive analytics. This domain is

directly associated with data science, in which assorted techniques are used for data analytics, along with statistics, computational engineering, machine learning and many others.

The stream of data science integrates a number of key constituents so that the data sets can be analysed with accuracy.

The key elements and perspectives of data science include data streaming, data pre-processing, feature engineering, analysis and plotting.

Grafana: A high performance tool for data science

Plotting and visualisation are important and frequently used approaches in data
