

Red Hat OpenStack Platform 15 delivers enhanced security and network performance

Red Hat has launched Red Hat OpenStack Platform 15, the latest version of its highly scalable and agile cloud Infrastructure-as-a-Service (IaaS) solution.

According to the company, the latest release of Red Hat OpenStack Platform brings together community-powered innovations with enterprise-ready stability and support. It enhances infrastructure security and cloud-native integration across the open hybrid cloud.

“Based on the OpenStack community’s ‘Stein’ release, Red Hat OpenStack Platform 15 adds performance and cloud security enhancements, and expands the platform’s ecosystem of supported hardware, helping IT organisations to more quickly and securely support demanding production workloads,” the company said in an official statement.

Red Hat OpenStack Platform 15 is built on the backbone of Red Hat Enterprise Linux 8.

Joe Fernandes, vice president, products, cloud platforms, Red Hat, commented, “Red Hat OpenStack Platform 15 delivers massively-scalable private cloud infrastructure that is hybrid cloud-ready today, and built on top of the world’s leading enterprise Linux platform, pairing innovation with an intelligent operating system to help enterprises get the most out of a hybrid cloud future.”

The project has taken over 100,000 code pull requests from the community, which is indicative of its collaborative nature, Hunter said.

Red Hat reports increasing interest in the hybrid cloud in Asia Pacific

An increasing number of cloud and managed service providers are joining the Red Hat Certified Cloud and Service Providers programme in Australia, China,

India, Japan, Korea, Singapore, Thailand, the Philippines and Vietnam.

This shows that there is a rising interest for the hybrid cloud in Asia Pacific (APAC), said sources at Red Hat.

According to the company, more than 300 cloud, systems integrator and managed service

providers in the Asia Pacific region have enrolled in the programme.

“As innovation and agility become essential to succeed in today’s competitive business environment, organisations in Asia Pacific have shown an increased interest in the hybrid cloud,” said Andrew Habgood, senior director, cloud partners, Asia Pacific, Red Hat.

“To help them harness the full value of the hybrid cloud, we are committed to empower our partners by offering solutions that provide a solid foundation for cloud-native strategies. Red Hat Certified Cloud and Service Providers are able to deliver high-quality cloud services using the latest open source technologies and innovation,” Habgood added.

Microsoft’s open source voting software is now available on GitHub

Back in May 2019, Microsoft CEO Satya Nadella had announced ElectionGuard, a free open source software development kit (SDK), as part of the company’s Defending Democracy Program.

After various demonstrations, Microsoft has now finally released ElectionGuard on GitHub to enable election technology suppliers to integrate it into their voting systems.

Microsoft says ElectionGuard will enable end-to-end verification of elections, open results to third-party organisations for secure validation, and allow individual voters to confirm their votes were correctly counted.

ElectionGuard is an open source software development kit (SDK) that makes voting more secure, transparent and accessible.

The ElectionGuard SDK leverages homomorphic encryption to ensure that votes recorded by electronic systems of any type remain encrypted, secure and secret. Meanwhile, ElectionGuard also allows verifiable and accurate tallying of ballots by any third party organisation without compromising secrecy or security.

According to Microsoft, ElectionGuard is being incorporated by all major manufacturers of voting systems in the United States, such as Clear Ballot, Democracy Live and VotingWorks.

The company is also working on a number of pilot programmes that it says will “put voting systems running ElectionGuard in the hands of voters for the 2020 elections or sooner.”
