

Check these Cool Windows-compatible Open Source OSs for the Desktop!

Let's face facts. Most computer users begin computing on a Windows machine. In March 2019, Microsoft reported that Windows was running on more than 800 million devices. Be that as it may, many Windows users would like to explore other operating systems. While Linux is the all time favourite open source alternative, there are other OSs too that offer a lot.

Are you fed up with using your Windows or macOS? Or do you need a new and fast operating system that doesn't cost you anything? Alternatively, you might be someone

who just likes trying out different OSs, or are interested in one because your colleagues are using it.

Well, you can find many operating systems online that are stable and feature-rich. In this article, we've

posted the best open source operating systems that you can run smoothly on your PC.

1. FreeBSD

Many feel that FreeBSD is just another Linux distribution. With the UNIX-like roots of Linux, FreeBSD is the current, open source version of the Berkeley Software Distribution (BSD). FreeBSD can be considered a relative of Linux and its code can be identified in many places. These include Sony's PlayStation 4 and Apple's macOS.

Overall, FreeBSD is a steady operating system for servers and desktops. While it doesn't ship with a desktop environment by default, there is protection for GNOME, KDE and Xfce desktops.

FreeBSD will interest organisations with security and privacy considerations, as it offers enhancements created by the TrustedBSD project. These include McAfee, DARPA, Google, University of Cambridge Computer Laboratory, Apple and many more.
