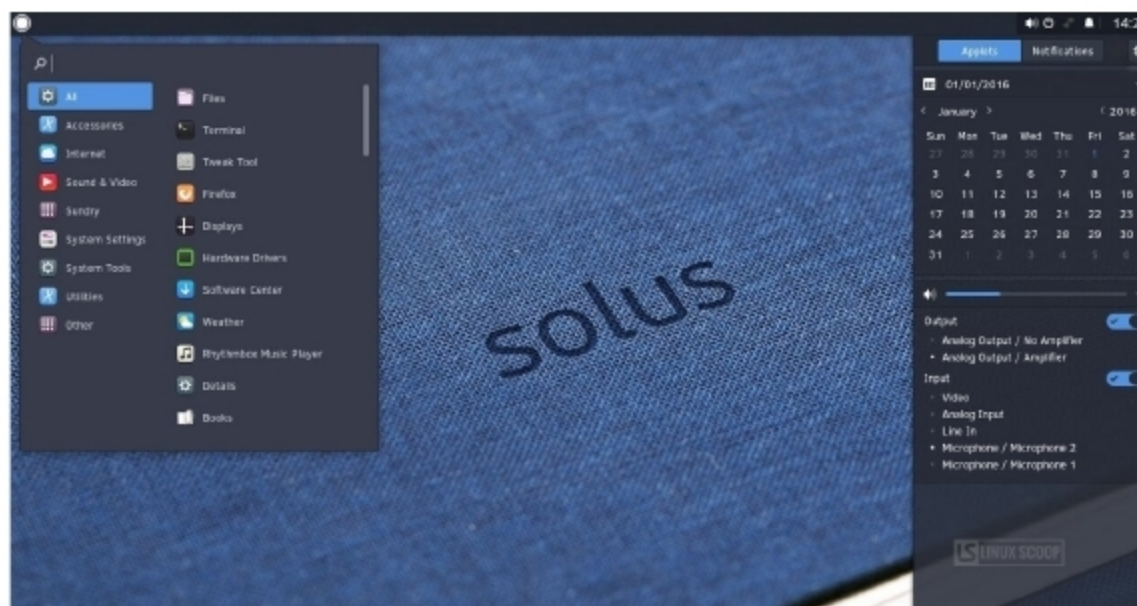

Figure 4: Solus

2. ReactOS

ReactOS is completely open source, accepting no proprietary Windows code, yet is designed to be compatible with Windows drivers and functions. But this compatibility varies – it's undoubtedly not going to work well with high-end games or programs, and ReactOS isn't really up to the Windows 10 level yet. It's currently aiming at full rapport with Windows Server 2003.

ReactOS does have its benefits. Incorporating elements of noted Windows emulator Wine, it runs LibreOffice, Firefox, Opera and more, quite freely and can indeed run commercial applications like Adobe Photoshop.

Given that ReactOS is free, it's worth checking if any of your older work-critical applications are compatible – setting up workstations without Windows licensing is an enticing prospect, although we can't vouch for its resistance to attacks.

3. Fedora

Fedora is another famous Linux based operating system, which is arguably the best open source OS. It is a general-purpose OS that is RPM-based, endorsed by Red Hat and shaped by the Fedora Project community.

Fedora's mission is to offer open source and cutting-edge technology for open source projects. Therefore, Fedora planners choose to start upstream changes as opposed to creating fixes exclusively for Fedora. All Linux distributions can advance from updates issued by Fedora developers.

Fedora has a GNOME based desktop that can be personalised. And the Fedora Spins feature can support, adjust and take care of changes in the user interface and desktop environment.

4. Solus

Solus is a free, open source operating system that can be adapted for your desktop. It is a new operating system in the Linux family and was established in 2012. More than 6000 registered customers use the software at present.

Solus' features include VLC, the LibreOffice suite, Transmission, XChat,
