

Create a new repository

A repository contains all project files, including the revision history. Already have a project repository elsewhere? [Import a repository.](#)

Owner 2DSharp / **Repository name *** learning-git ✓

Great repository names are short and memorable. Need inspiration? How about super-duper-funicular?

Description (optional)
Learning git is fun!

☒ **Public**
Anyone can see this repository. You choose who can commit.

☐ **Private**
You choose who can see and commit to this repository.

Skip this step if you're importing an existing repository.

☒ **Initialize this repository with a README**
This will let you immediately clone the repository to your computer.

Add .gitignore: **None** | Add a license: **None** ⓘ

Figure 1: Creating a GitHub repository

Figure 2: GitHub repository home page

After that, you are given a choice of creating either a public or private repository. Private repositories are only accessible to the owner and other collaborators of the repository. For now, we will create a public open source repository for everyone to access. You can make it private later on, in the settings.

GitHub then asks you to include a README file. This is an important file that describes the purpose of your repository with brief instructions on how to use it. It's a good practice to have a README in each repository, so click the checkbox that states: 'Initialise this repository with a README'.

Then you can add a `.gitignore` file. Select *none* from the list — we will create it manually in later steps. You can also choose a licence, though this is not necessary. You can add a licence to state the exact terms under which users of your project have to work.

You can visit <https://choosealicense.com/> for more information about choosing licences.

Go ahead and click 'Create repository' once you are done. GitHub will prepare a brand new repository for you, which is now publicly accessible at <https://github.com/your-username/repository-name>. You should be presented with a page similar to what's shown in Figure 2.

This is the page where all your files are hosted. You can check the history, branches, collaborators and everything else about them that you will need for your project.

Configuring Git on Windows

Now, let us first check out the Git CLI tool for Windows. Just visit <https://git-scm.com/download/win> to download the Windows client installer.

Once it's downloaded, run the installer and the client installation wizard will take you through the steps necessary.

1. Select the desired location for installation; then, on the next page, you will be prompted to make a few selections. Check Figure 3 for a safe set of choices.

Make sure you select Git Bash here in order to be able to easily access it from Windows Explorer. Hit *Next* and *Select* if you want to have a start up option for Git.

2. After this step, you will be prompted to choose the default editor. If you haven't used Linux enough, chances are that you don't already know Vim, which is selected as default. Go ahead and select 'Use the Nano editor by default'. Nano is a relatively easy and simple text editor that will get
