Figure 5: Git status

```

MINGW64:/c/Users/2D/learning-git
Your branch is up to date with 'origin/master'.

Changes to be committed:
  (use "git restore --staged <file>..." to unstage)
        new file:   hello.c

2D@DESKTOP-VCB390N MINGW64 ~/learning-git (master)
$ git commit

*** Please tell me who you are.

Run

  git config --global user.email "you@example.com"
  git config --global user.name "Your Name"

to set your account's default identity.
Omit --global to set the identity only in this repository.

fatal: unable to auto-detect email address (got '2D@DESKTOP-VCB390N.(none)')

2D@DESKTOP-VCB390N MINGW64 ~/learning-git (master)

Explorer to that directory is by running the following code:

```
explorer.exe .
```

Notice that the '.' in the code means 'current location'. This will directly open Windows Explorer in the current working directory.

Here you can make a new file with your favourite text editor. For example, let's create a simple C source file called *hello.c*

You can also use Nano for this and run the following command:

```
nano hello.c.
```

You can save the file after editing it by pressing *Ctrl+O* and exit Nano by pressing *Ctrl+X*.

Once you are done saving the file in your repository folder, go to the Git CLI and run Git status.

You can open the Git Bash CLI from Windows Explorer by going to your desired directory, right clicking and selecting Git Bash here.

As you can see, your *hello.c* file is untracked, which means it has not been added to Git yet. To add it, simply run the following command:

```
git add hello.c
```

To remove a file from Git, use the following command:

```
git rm <filename>
```

If you want to remove a file name only from the server but not from your computer, type the command shown below:

```
git rm --cached <filename>
```

This way your file will be removed from the server but will remain in your computer as long as you don't add it again.

Now you can see that the file has been added and is ready to be committed. A commit is a collection of changes in your repository. Think of it as adding a new feature or fixing a bug. Since we have added a new file to our repository, we will have to commit that change for it to be logged in the Git history.

Later on if we want to revert to a previous version, we can use a command to return to a specific commit.

To commit your changes, run:

```
git commit
```

If this is your first time on Git, you will get a message like the one shown in Figure 6.

So you have to tell the Git client who you are by giving your credentials. These credentials will be linked to all of your commits, so Git will know who made what changes in a collaborative environment.

Next, run the following commands:

```
git config --global user.email "<your email address linked to git>"
git config --global user.name "<Your name in Github>"
```

Now run *Git commit* again and you will see the Nano editor open up. Here you'll have to write your commit
