

Global tech giants form foundation to help scale the Presto community

Facebook, Uber, Twitter and Alibaba have joined hands to form a foundation to help Presto, a database search engine and processing tool, scale and diversify its community.

The Presto Foundation will be now hosted under the Linux Foundation. The former will operate under a community governance model with representation from each of the founding members. The foundation aims to make the Presto engine “the fastest and most reliable SQL engine for massively distributed data processing.”

“The Linux Foundation is excited to work with the Presto community, collaborating to solve the increasing problem of massive distributed data processing at Internet scale,” said Michael Dolan, VP of strategic programmes at the Linux Foundation.

Presto was developed at Facebook in 2012 as a high-performance distributed SQL query engine for large scale data analytics. Presto’s architecture allows users to query a variety of data sources such as Hadoop, S3, Alluxio, MySQL, PostgreSQL, Kafka and MongoDB, and move at scale and speed.

It can query where data is stored without needing to move the data to a separate system. Its in-memory and distributed query processing results in query latencies ranging from seconds to minutes.

and improvements, and offers fans of the lightweight Xfce desktop environment all the latest and best GNU/Linux technologies and open source software. The major highlight of this release is the inclusion of the recently launched Xfce 4.14 desktop environment.

GitHub acquires code analysis tool Semmle

Ten years ago, GitHub introduced the pull request that created a standard process

GITHUB TO ACQUIRE SEMMLE

for managing contributions. Now the team is focused on building better-defined processes to manage vulnerabilities in open source code.

Along with announcing the Semmle acquisition, the code hosting platform has disclosed a number of improvements that

make it easier for maintainers and developers to fix and protect against vulnerabilities.

Semmle is a code analysis tool that helps developers and security researchers discover potential vulnerabilities in their code. “Its code analysis engine, named QL, combines the latest research in compiler optimisation with insights in database implementation. It understands the complex data structures inherent in code, and makes analysis available to researchers using a declarative, object-oriented query language,” a GitHub blog post reported.

According to sources at GitHub, over 100 CVEs (common vulnerabilities and exposures) in open source projects have been found to be using Semmle, including high-profile projects like Apache Struts, Apple’s XNU, the Linux kernel, Memcached, U-Boot and VLC.

ADLINK becomes a member of ROS 2 Technical Steering Committee

ADLINK Technology, a leading provider of edge computing solutions, has joined the ROS 2 Technical Steering Committee (TSC) to contribute to building an open source robotics ecosystem.

The Robot Operating System (ROS) is the world’s leading open source resource for roboticists. It is one of the two open source products offered by Open Robotics, an independent non-profit organisation founded by members of the global robotics community.

The ROS 2 TSC was launched in September 2018 to broaden participation in ROS 2 development and accelerate ROS 2 delivery. The ROS 2 TSC sets the technical direction for open robotics and comprises organisations actively contributing to the development and success of ROS 2.

Current members include Amazon, Arm, Bosch, Intel and LG Electronics, among others.
