

Microsoft exFAT by Paragon Software now supports new Linux kernel 5.2

The updated Microsoft exFAT by Paragon Software driver comes with rapid and transparent read and write access to exFAT volumes from Linux, additional performance optimisation for modern Linux kernels and lower CPU memory consumption.

Paragon's proprietary exFAT technology is available for implementation into Linux, Android and other embedded operating systems, as well as real-time operating systems like QNX and Integrity.

It is officially covered by Microsoft patent rights and is available for direct implementation to OEMs, ODMs and independent software vendors for integration into devices as well as antivirus, forensic and data recovery solutions without the need to obtain Microsoft licensing.

In addition, it is provided with full technical support and can be customised to meet any specific requirements.

"Paragon Software provides key storage technology software stacks that will ensure the best customer experience through leading performance, high stability, seamless interoperability and full data safety," commented Konstantin Komarov, CEO at Paragon Software.

The Paragon exFAT driver is based on the company's proprietary File System Link (formerly, UFSD) cross-platform technology that enables any device to communicate and gain access to storage media regardless of file system type.

By leveraging the existing ecosystem – including Binance Chain, Binance.com APIs, Trust Wallet SDKs and the Binance Charity donation platform – Binance X says it will support educational advancement at every level – "from noobs to seasoned developers."

Open source startup Snyk raises US\$ 70 million in new funding

Snyk, a London and Boston based company that develops security solutions for developers working on open source code, has raised US\$ 70 million in a funding round led by Accel, with participation from existing investors GV and Boldstart

Ventures. Guy Podjarny, Assaf Hefetz and Danny Grander – all graduates of the IDF 8200 intelligence unit – founded Snyk in 2015.

Last September, the company raised US\$ 22 million, bringing the company valuation to US\$ 100 million, according to *Techcrunch*. A source close to the startup told the daily that the company's revenue has grown four-fold over the past year and now stands in the range of US\$ 500 million.

The fresh funding will be used to continue expanding the firm's capabilities and overall business. The company has recently started building security solutions to help developers identify and fix vulnerabilities around containers.

"This investment helps us continue to bring Snyk's product-led and developer-focused solutions to more companies across the globe, helping them stay secure as they embrace digital innovation – without slowing down," said the company's CEO Peter McKay.

The company has 170 employees, of which 60 work in its Tel Aviv development centre.

Ericsson acquires Niche AI workforce for India centre

Ericsson has reportedly acquired the workforce of Niche AI for its Bengaluru-based artificial intelligence (AI) centre and is looking for more buyouts to build a team of 150 high-tech engineers for its India operations this year.

Niche AI is an early stage AI start-up that designs accurate and computationally light algorithms to solve computer vision problems.

The Swedish telecom gear maker did not disclose the financial details of the acquisition, but said that, "...the size of the acquisition itself is small."

"The Niche AI 'acqui-hire' was in single digits in terms of the size of the workforce," said Sanjeev Tyagi, head of Ericsson R&D, Bengaluru.

Ericsson started the Indian wing of its Global Artificial Intelligence Accelerator (GAIA) last year to develop open source solutions to modernise its telecom network, using AI and machine learning.

Tyagi said that as adoption of 5G technology starts to increase, there will be a huge proliferation of IoT devices and a large number of different elements in the network, which can be efficiently managed only through AI and ML-like technologies, for which GAIA is developing solutions.

Sophos releases sandbox-based isolation program Sandboxie as a free tool

UK cyber-security firm Sophos has made Sandboxie, a sandbox-based isolation
