

DVD OF THE MONTH

Lightweight Linux for you.

Peppermint 10

Peppermint 10 is built on the Ubuntu 18.04 LTS code base and makes use of its package repositories. It uses the *Xfwm4* window manager, and the *Xfce* bottom panel in the LXDE desktop environment. Ice, which is Peppermint's handy cloud and Web application management tool, continues to put Web apps on an equal footing with locally installed ones by allowing them easy integration into system menus, and delivery to the desktop via SSBs (site specific browsers) so they mimic locally installed applications. The bundled DVD is live and bootable for you to try Manjaro.

Manjaro Linux 18.1.0

Manjaro is a professionally built Linux based operating system that is a suitable replacement for Windows or MacOS. It's a fast, user-friendly, desktop-oriented OS based on Arch Linux. Manjaro is an excellent entry point into the Linux world. Unlike proprietary operating systems, Manjaro gives you full control over your hardware, without restrictions. This makes it ideal for those who want to learn how Linux works and how it is different to other operating systems. You can find the ISO image of the distribution in the *other_isos* folder on the DVD.

Slax 9.11.0

Slax is a modern, portable, small and fast Linux operating system with a modular approach and outstanding design. It runs directly from your USB Flash drive without the need for installation, so you can carry it everywhere you go, in your pocket. Despite its small size, Slax provides a nice graphical user interface and a wise selection of pre-installed programs, such as a Web browser, a terminal, and more.

What is a live DVD?

A live CD/DVD or live disk contains a bootable operating system, the core program of any computer, which is designed to run all your programs and manage all your hardware and software.

Live CDs/DVDs have the ability to run a complete, modern OS on a computer even without secondary storage, such as a hard disk drive. The CD/DVD directly runs the OS and other applications from the DVD drive itself. Thus, a live disk allows you to try the OS before you install it, without erasing or installing anything on your current system. Such disks are used to demonstrate features or try out a release. They are also used for testing hardware functionality, before actual installation. To run a live DVD, you need to boot your computer using the disk in the ROM drive. To know how to set a boot device in BIOS, please refer to the hardware documentation for your computer/laptop.
