

like Amazon Web Services, Microsoft Azure and Google Cloud Platform. It's important to upskill constantly and sharpen one's database, programming, Linux and DevOps skills.

Q What are the types of roles that you typically hire for?

We hire across experience levels for our India R&D centre, from college graduates to senior engineers. Some of the roles that we typically hire for include software developers, software architects, cloud architects, cloud operations engineers, automation developers, QA engineers, programmer analysts, and systems analysts.

Q Could you tell us more about the academia partnership programmes conducted by NetApp?

NetApp collaborates with universities on several levels. Other than internships, code-a-thons, and university hiring programmes, we run an Academic Alliances Programme and a University Research Partnership programme. The latter has been in operation since 2007 and is led by the research team at NetApp, the Advanced Technology Group. The primary focus is to collaborate with professors of international repute, who are conducting research in technology areas that are of interest to NetApp.

The programme revolves around two types of fellowships granted to the institute. The NetApp Faculty Fellowship (NFF) is the flagship grant that NetApp provides to internationally acclaimed professors for furthering their research agenda. NetApp engineers work with the professor and the students collaboratively on research problems of industry interest for 18 months. The second type of fellowship we provide is to support students directly and is the central part of the NetApp Student Fellowship (NSF). This program is for a period of one year. During this phase, we take

the professor's recommendations on an interesting student research project, typically a part of a larger project, and provide grants on the same lines as the NetApp Faculty Fellowship (NFF).

The NetApp University Research Programme has led to fruitful collaborations with reputed universities across the country like the Indian Institute of Science and Research; the IITs in Delhi, Kanpur, Hyderabad, Kharagpur, Guwahati and Bombay; as well as the IIIT Bengaluru and ISI Kolkata, among others. Through these partnerships, progress has been made in the fields of building systems that give early warning of impending problems, and proactive problem avoidance. The research has led to the goal of setting up self-healing, self-correcting systems using machine learning and analytics. These research relationships help in identifying important tech trends on the horizon. Spotting such a trend, building expertise around it and finding out its implications are essential to remain at the cutting-edge of technology.

Q Could you briefly tell us about the NetApp Academic Alliances Programme?

With the Academic Alliances Programme, NetApp works with faculty at colleges and universities to provide them the teaching resources to infuse storage, data management, and cloud-related content into their curriculum. The goal is to help develop students' expertise in data management technology and build industry-ready talent to drive the ecosystem in the long term. The programme aims at enriching the learning opportunities for students.

We conduct an innovative boot camp, which is a technical training and certification programme for graduates and faculty. Participants from eminent technology colleges spend two days at our Bengaluru campus to understand the technologies of NetApp. They also get to interact with NetApp executives

Job Guaranteed.

You don't need a training institute. Just do it yourself.
