Figure 6: Enabling Google Colaboratory from Google Drive

BigML

URL: <https://bigml.com/>

BigML is a cloud based platform for the implementation of advanced algorithms with assorted data sets. This cloud based platform has a panel for implementing multiple machine learning algorithms with ease.

The BigML dashboard has access to different data sets and algorithms under supervised and unsupervised taxonomy, as shown in Figure 4. The researcher can use the algorithm from the menu according to the requirements of the research domain.

A number of tools, libraries and repositories are integrated with BigML so that the programming, collaboration and reporting can be done with a higher degree of performance and minimum error levels.

Algorithms and techniques can be attached to specific data sets for evaluation and deep analytics, as shown in Figure 5. Using this methodology, the researcher can work with the code as well as the data set on easier platforms.

The following are the tools and libraries associated with BigML for multiple applications of high performance computing:

- Node-Red for flow diagrams
- GitHub repos
- BigMLer as the command line tool
- Alexa Voice Service
- Zapier for machine learning workflows
- Google Sheets
- Amazon EC2 Image PredictServer
- BigMLX app for MacOS

Google Colaboratory

URL: <https://colab.research.google.com>

Google Colaboratory is one of the cloud platforms for the implementation of high performance computing tasks including artificial intelligence, machine learning, deep learning and many others. It is a cloud based service which integrates Jupyter Notebook so that Python code can be executed as per the application domain.
