

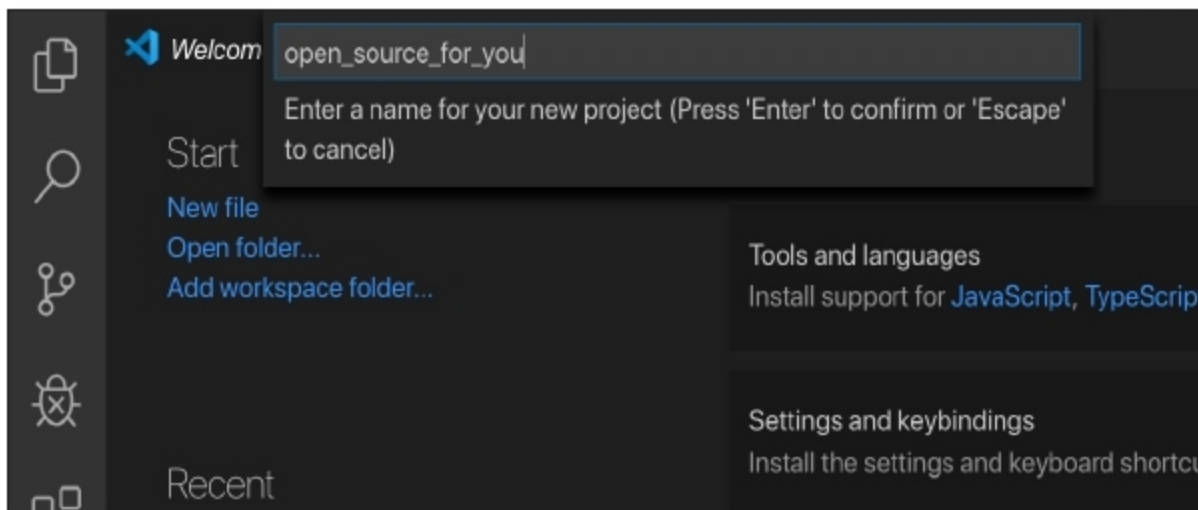

Figure 3: Naming the project

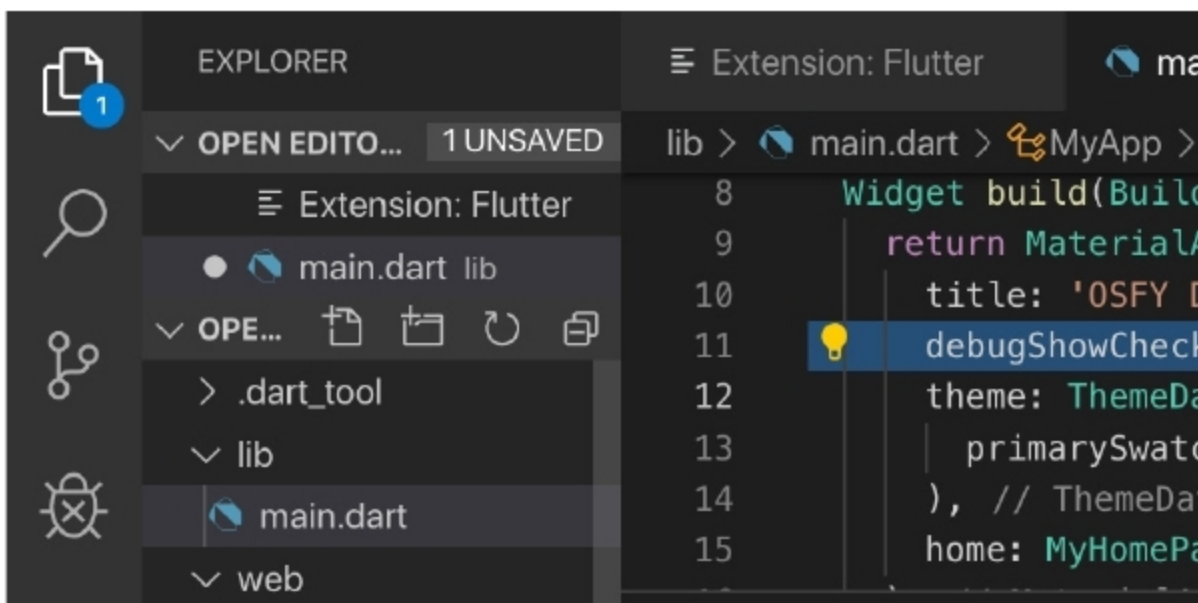

Figure 5: Location of main.dart file

```
<script defer src="main.dart.js"
type="application/javascript"></script>
```

Coding and making changes to the demo page

Let's create a simple application, which will print 'Welcome to OSFY' on the Web page.

Let's now open the Dart file, which is located in the *lib* folder *main.dart* (the default name) (see Figure 5).

We can now remove the debug tag using the property of *MaterialApp*, as follows:

```
debugShowCheckedModeBanner: false
```

Now, adding more into the Dart file is very similar to writing code in Flutter in Dart. For that, we can declare a class titled *MyClass*, which extends the *StatelessWidget*.

We use a *Center* widget to position elements to the centre. We can also add

a *Padding* widget to add padding. Use the following code to obtain the output shown in Figure 5. Use the *Refresh* button to view the changes.

```
class MyClass extends StatelessWidget {
  @override
  Widget build(BuildContext context) {
    return Scaffold(
      body: Center(
        child: Column(
          mainAxisAlignment:
MainAxisAlignment.center,
          children: <Widget>[
            Padding(
              padding: EdgeInsets.
all(20.0),
            child: Text(
```

Figure 4: The Flutter demo application running on port 8080

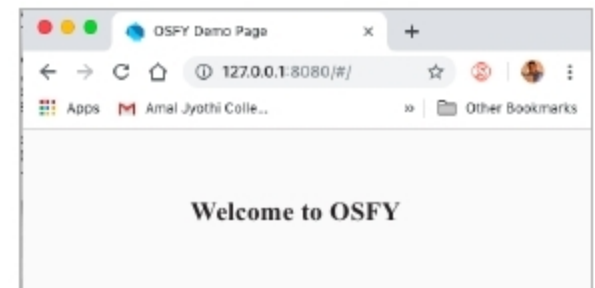

Figure 6: Output of *MyClass*

Figure 7: Final output

```
'Welcome to OSFY',
style: TextStyle(fontSize:
24.0, fontWeight: FontWeight.bold),
),
),
],
),
),
);
}
}
```

Let's add an image from the Internet – I've chosen the 'Open Source for You' logo from the magazine's website. We use *Image.network*.

```
Image.network(
  'https://opensourceforu.com/wp-content/uploads/2014/03/OSFY-Logo.jpg',
  height: 100,
  width: 150
),
```

The final output is shown in Figure 7.
