

We can start with solution modelling in Cacoo either by using the AWS diagram templates, which list pre-built templates for standard architecture diagrams like the network diagram, DevOps solutions, etc. If you want to develop a custom solution from the list of shapes available in the Cacoo online editor, you can choose AWS components like compute, storage, network, analytics, AI tools, etc, and prepare custom architecture to suit your solution, as shown in Figure 2.

There are connectors available to relate the components (for example, how network communication happens, and how ELB or elastic load balancing branches to EC2 storage). Figure 3 lists sample diagram shapes available for AWS architecture diagrams in Cacoo.

Integrating Cacoo with an AWS account to import architecture

One of the biggest advantages of Cacoo compared to other cloud modelling tools is that it can import architecture from an AWS account. We can connect to

Options

☒ Require external ID (Best practice when a third party will assume this role)

You can increase the security of your role by requiring an optional external identifier, which prevents "confused deputy" attacks. This is recommended if you do not own or have administrative access to the account that can assume this role. The external ID can include any characters that you choose. To assume this role, users must be in the trusted account and provide this exact external ID. [Learn more](#)

External ID

Cacoo-AWS-Integration|

Important: The console does not support using an external ID with the Switch Role feature. If you select this option, entities in the trusted account must use the API, CLI, or a custom federation proxy to make cross-account iam: AssumeRole calls. [Learn more](#)

☐ Require MFA
