

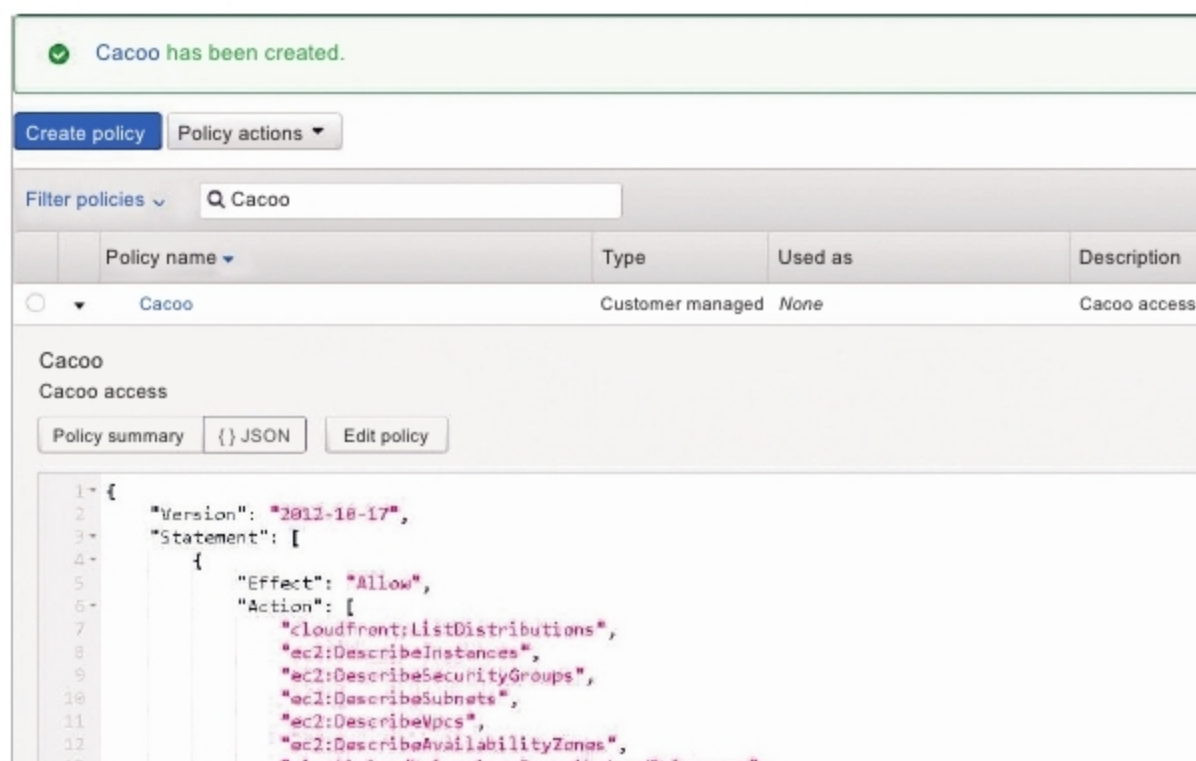

Figure 5: Add the policy to the IAM role to enable Cacoo to import from the AWS account

AWS Architecture

IAM Role Access Key

Cacoo can now connect to AWS to draw diagrams of your architecture! You will need a new IAM role with the following permissions.

AWS Account ID 631054961367 Copy

External ID Cacoo-AWS-Integration Copy

Policy {
"Version": "2012-10-17",
"Statement": [{
 "Effect": "Allow",
 "Action": [
 "cloudfront:ListDistributions",
 "ec2:DescribeInstances",
 "ec2:DescribeSecurityGroups",
 "ec2:DescribeSubnets",
 "ec2:DescribeVpcs",
 "ec2:DescribeAvailabilityZones",
 "elasticloadbalancing:DescribeLoadBalancers"
]
}]
}

After you access permissions from your AWS account copy and paste your Role ARN.
*Cacoo does not store your Role ARN after importing your AWS architecture.

Figure 6: Cacoo's AWS Architecture Import wizard

an AWS account, and Cacoo selects the services created in the account with the role attached and prepares an architecture diagram, on the fly.

For this, we need to first create an IAM (Identity and Access Management) role in the AWS account with the

account ID and external ID as given in the Cacoo Import AWS Architecture account (Figure 4).

Then we need to add a policy to the IAM role in order to access the components attached to this role from Cacoo. For policy creation, we have sample policies available in Cacoo's

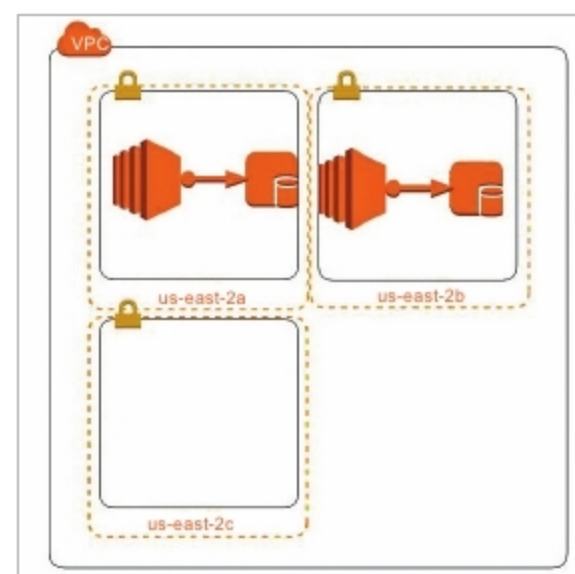

Figure 7: Cacoo's worksheet with AWS imported architecture

Import AWS Architecture wizard. We just need to copy and paste the policy as shown in Figure 5.

Once this is done, the IAM role is created in the AWS account. Now we need to copy the role ARN (Amazon Resource Name) from the new role created and paste it in Cacoo's Import AWS Architecture wizard as shown in Figure 6. This imports the architecture of the services created in the account, which is attached to the IAM role we have created and displays it as an architecture diagram.

Once this is done, we can see the architecture in Cacoo's worksheet (Figure 7). We can print or export the architecture diagram into PPT, PNG, SVG, PDF, etc, for an architecture document, or for poster printing and other technical discussion purposes, as needed.

Cacoo is one of the most powerful cloud architecture modelling tools and can be used for visual designs for AWS architecture, on the fly, using online tools without installing any software. The online account is accessible from anywhere and can be used for quick architecture presentation. **END** 🐧
