

Currently, xBrowserSync supports the Mozilla and Chrome browsers; so if you're using either one of them, you can proceed further. Also, if you have to transfer a huge number of bookmarks from your existing service to xBrowserSync, it is advised that you have a backup of all your bookmarks before you create your first sync.

You can create your first sync by entering a strong password for it. After your sync is created, a unique sync ID will be shown to you, which can be used to sync your bookmarks across your devices.

xBrowserSync encrypts all your data locally before it is synced. It also uses PBKDF2 with 250,000 iterations of SHA-256 for the key derivation to combat brute force attacks. Apart from that, It uses PBKDF2 with 250,000 iterations of SHA-256 for the key derivation to combat brute force attacks. And it uses AES-GCM with a random 16 byte IV (Initialization Vector- a

random number that is used with secret key to encrypt the data) with 32-bit char sync ID of the user as a salt value. All of these are in place to ensure that your data cannot be decrypted without your password.

The app provides you with a sleek interface that makes it easy for you to add bookmarks, and share and edit them by adding descriptions and tags to them.

xBrowserSync is currently hosted by four providers, including the official one. So to accommodate all the users, the synced data that isn't accessed for a long time is removed. If you don't want to be dependent on other providers, you can host xBrowserSync for yourself.

Scrambled Exif

When we share our photos on social media, sometimes we share the metadata on those photos accidentally. Metadata can be useful for some situations but it can also pose a serious threat to your privacy. A typical photo may consist of the following pieces of data such as 'date and time', 'make and model of the camera', 'phone name' and 'location'. When all these pieces of data are put together by a system or by a group of people, they are able to determine your location at that particular time.

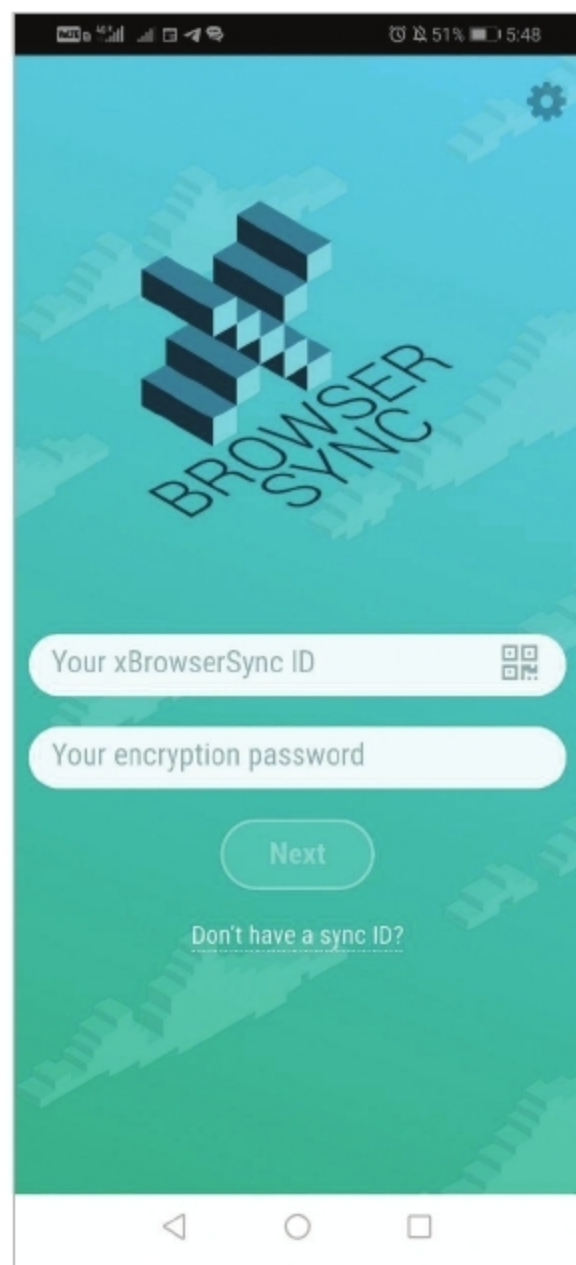

Figure 4: xBrowserSync

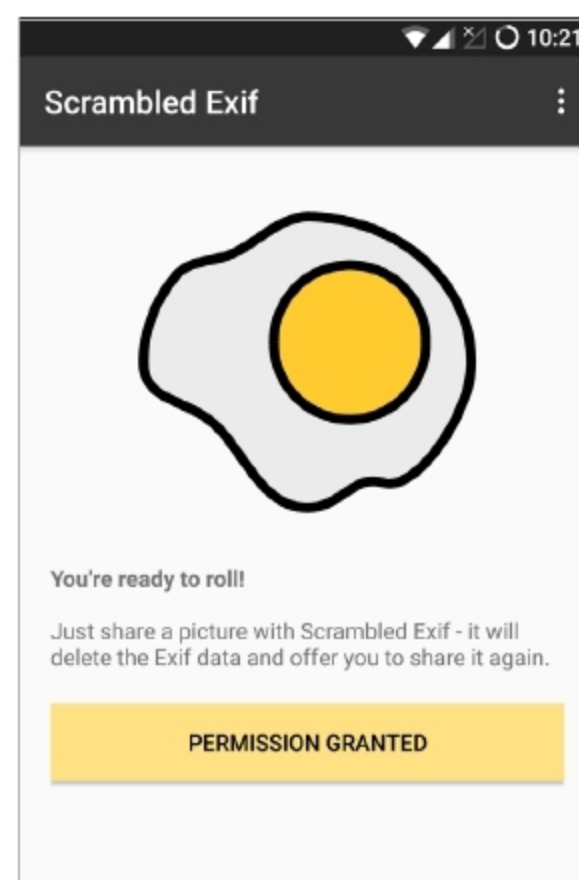

Figure 5: Scrambled Exif

So if you want to share your photos with your friends as well as on social media without divulging metadata, you can use Scrambled Exif.

Scrambled Exif is a free and open source tool which removes the Exif data from your photos, after installing the app. So when you want to share a photo, you have to click on the 'Share' button from the photo, and it will show you the available options for sharing — choose 'Scrambled Exif'. Once you have done that, all your metadata is removed from that photo, and you will again be shown the share list. From there on, you can share your photos normally.

Riseup VPN

Riseup VPN (Virtual Private Network) is a tool that enables you to protect your identity, as well as bypass the censorship that is imposed on your network and the encryption of your Internet traffic. Some VPN service providers log your IP address and quietly betray your trust.

Riseup VPN is a personal VPN service offered by the Riseup Organization, which is a non-profit that fights for a free Internet by providing tools and other resources for anyone who wants to enjoy the Internet without being restrained.

To use the Riseup VPN, you do not need to register, nor do you need to configure the settings — it is all prepped for you. All you need is to click on the 'Turn on' button and within a few moments, you can see that your traffic is routed through the Riseup networks. By default, Riseup does not log your IP address.

At present, Riseup VPN supports the Riseup networks in Hong Kong and Amsterdam.

Secure Photo Viewer

When you want to show a cool picture of yours to your friends by giving your phone to them, some of them may get curious and go to your gallery to view all your photos. Once you unlock the gallery, you cannot control
