

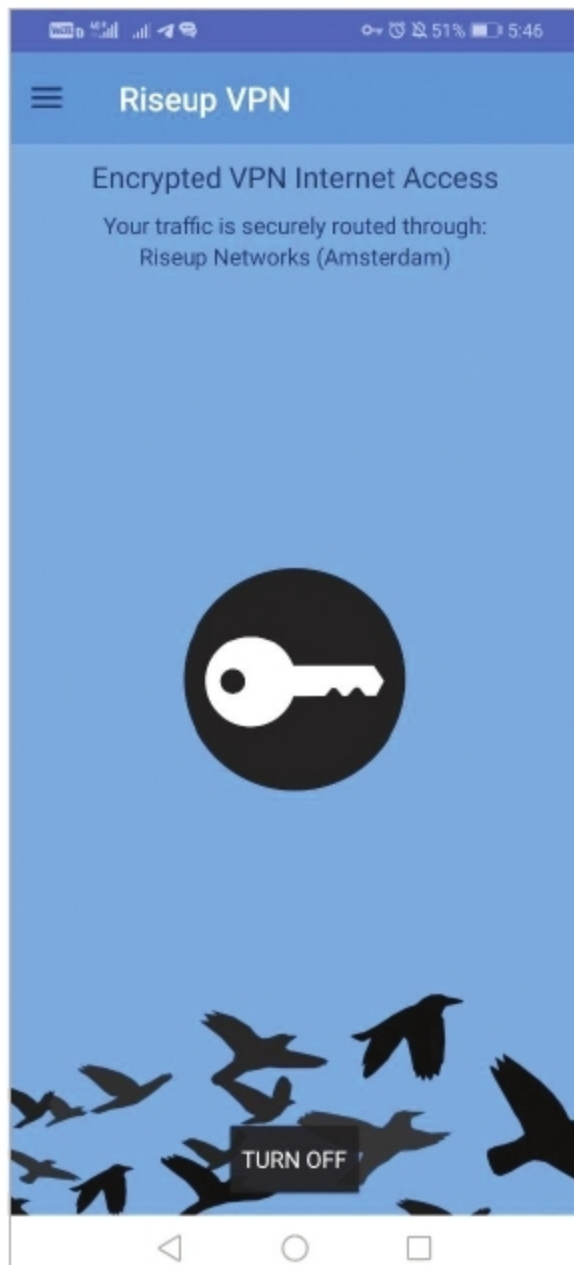

Figure 6: Riseup VPN

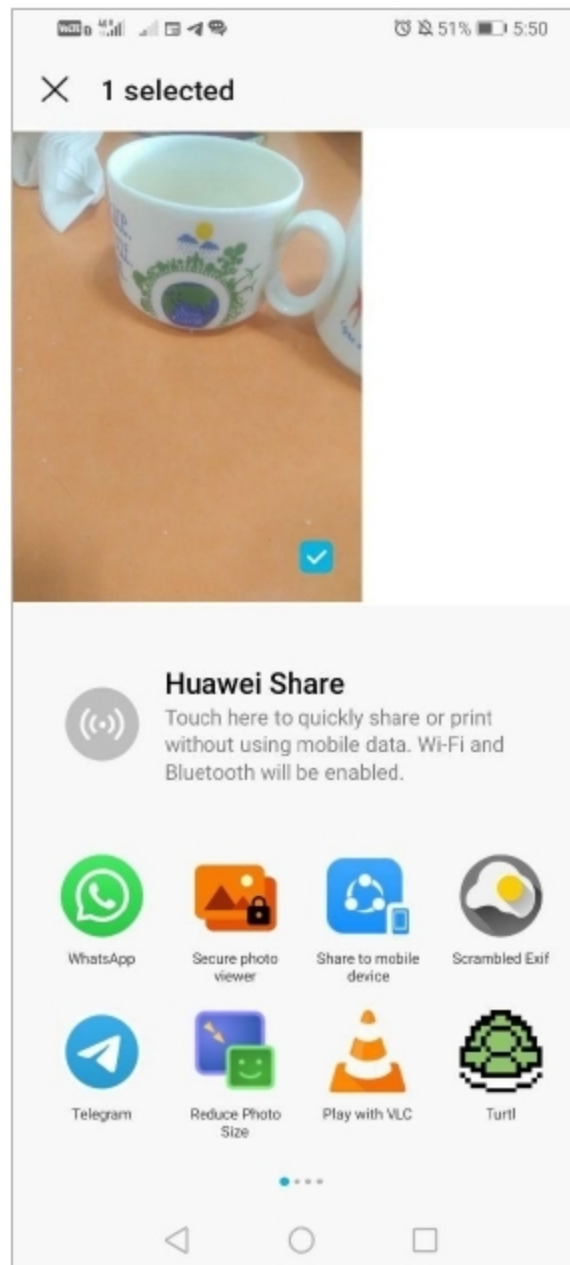

Figure 7: Secure Photo Viewer

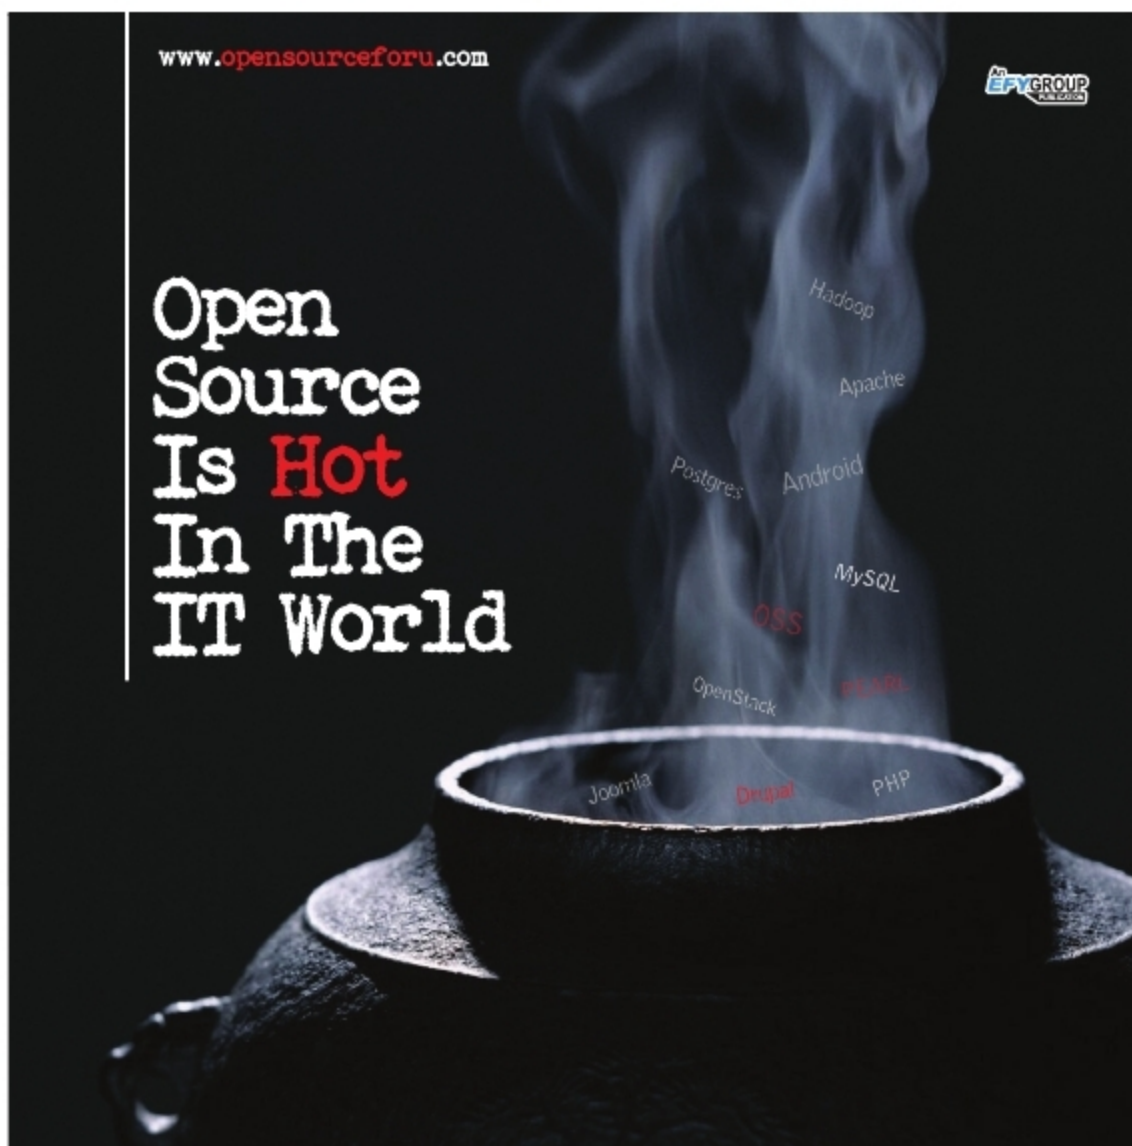

what should be shown and what ought to be hidden, as long as your phone is with them.

Secure Photo Viewer fixes this problem. After installing it, choose the photos or videos you want to show to a friend and click 'share'. This will show 'Secure Photo Viewer' in the available options. Once you click on it, a new window will open and it will instruct you to lock your device. Within a few seconds the photo you have chosen will show up on the screen. Now you can show your friends just that photo, and they can't get into your gallery and view the rest of your private photos.

Most of the apps listed here are available on F-Droid as well as on Google Play. I recommend using F-Droid because every app has been compiled via its source code by F-Droid itself, so it is unlikely to have malicious code injected in it. **END** 🐧
