

Samsung Electronics adopts international open source standard

Samsung Electronics has announced the adoption of OpenChain ISO (International Organization for Standardization) / IEC (International Electrotechnical Commission) 5230:2020, the first international standard for open source compliance. The OpenChain Project began in 2016 as an initiative of the Linux Foundation. It aims to establish an effective and consistent open source compliance system.

Shane Coughlan, general manager of OpenChain, said, “Open source provides an unmatched platform for innovation. To get the most out of this platform, the key is to have effective, efficient processes. OpenChain ISO 5230 delivers this for license compliance activities. We are delighted to welcome Samsung Electronics to our community of conformance. Their leadership in this area will help accelerate our mission throughout the supply chain.”

The OpenChain Project was adopted as an ISO / IEC international standard in 2020. The project evaluates each company’s open source compliance capabilities and grants certification if they meet the criteria.

Seungbeom Choi, executive vice president and head of R&D strategy team at Samsung Electronics, said, “Samsung Electronics leads the adoption and use of open source technology to create innovative products. Underlying this are organisations and processes specifically established to safely and efficiently utilise open source. Our adoption of OpenChain ISO 5230 reflects our ongoing commitment to excellence in our field. Samsung Electronics is expected to enhance its credibility by receiving recognition for its capacity to utilise open source through this certification. We look forward to collaborating with other industry leaders around this standard.”

Michel Tricot, co-founder and CEO of Airbyte, said, “Some open source solutions for CDC exist, but all of them are very hard to implement. Until now, there was no easy, no-code way of doing database replication with log-based change data capture technology. With Airbyte, any authorised user is able to start replicating databases within minutes without writing a line of code — not days later after significant work by engineering teams.”

“Airbyte now supports CDC to replicate data from Postgres and MySQL to data warehouses, lakes and databases. And Airbyte’s CDC is open source, so it’s possible to replicate databases while maintaining control of the data without having to go through a third-party service and risk additional privacy and security concerns,” he added.

Sophos acquires Capsule8

Sophos has announced that it has acquired Capsule8, a company that works in runtime visibility, detection and response for Linux production servers and containers covering on-premise and cloud workloads. Founded in 2016, Capsule8 is privately held and headquartered in New York. It is dedicated solely to the development of Linux security

and has established itself as a technology and thought leader in the market, with billings growth of 77 per cent in the year ending March 31, 2021.

Capsule8’s high-performance, low-impact design is aimed at Linux servers, especially those used for high-scale workloads, production infrastructure and storing critical business data.

Dan Schiappa, chief product officer, Sophos, said, “Sophos already protects more than two million servers for over 85,000 customers worldwide, and the Sophos server security business is growing at more than 20 per cent per year. Comprehensive server protection is a crucial component of any effective cybersecurity strategy that organisations of all sizes are increasingly focused on, especially as more workloads move to the cloud. With Capsule8, Sophos is delivering advanced, differentiated solutions to protect server environments, and expanding its position as a leading global cybersecurity provider.”

John Viega, CEO, Capsule8, said, “Capsule8 is the premiere purpose-built detection and response platform for Linux. We provide security teams with the crucial visibility they need to protect Linux production infrastructure against unwanted behaviour, while at the same time addressing cost, performance and reliability concerns. We’ve innovated new approaches to deliver runtime security in a much safer and more cost-effective way than anyone else in the industry. With Capsule8’s technology, organisations are no longer forced to choose between system stability and security risk. Given the growth and mission-critical nature of Linux environments, and the fast-changing, targeted threat landscape, organisations must be confident that their Linux environments are both performant and secure.”

AlmaLinux OS Foundation announces availability of OS for Arm processors

The AlmaLinux OS Foundation, a non-profit overseeing the only community-owned and community-driven open source enterprise-grade alternative to CentOS, has announced the availability of AlmaLinux OS for Arm processors. This is the result of cooperation among Arm, Amazon Web Services (AWS), Equinix, and the Oregon State University (OSU) Open Source Lab.
