

Servers and computers powered by Arm processors are now able to run the AlmaLinux OS, which can be downloaded from any of the more than 130 mirrors around the world. Images for use on cloud computing platforms (including cloud-init, AWS, Google Cloud, Docker and Vagrant) are available on GitHub.

Jack Aboutboul, community manager of AlmaLinux, said, “One of our guiding principles is to be true to open source, to work together and to contribute upstream for everyone’s benefit. The indispensable help from ARM, AWS, Equinix Metal, and Oregon State University – both in terms of infrastructure used for development and testing as well as their tremendous technical expertise — reflects the true nature of community. We’re already seeing lots of user adoption on AWS, which was instrumental in ensuring that workloads in the cloud on Graviton processors are well supported and now we have Amazon Machine Images (AMIs) available in every region. Equinix Metal also worked closely with us in a mutual collaboration where we’ve contributed upstream to their Tinkerbell open source bare metal provisioning platform.”

The latest 8.4 release of AlmaLinux OS for Arm includes a new geo-location based mirror infrastructure to ensure fast downloads for updates and new releases. It also has OpenSCAP security profiles support for production workloads, a repository for developers with extra packages and build dependencies, and new module streams and compiler updates.

Weaveworks launches Weave GitOps

Weaveworks has announced the release of Weave GitOps, a product that increases software delivery and operational performance for Kubernetes infrastructure and application teams. According to the company, these teams can take full advantage of lightning-fast continuous application delivery and automated operational control to gain competitive business success.

Alexis Richardson, founder and CEO of Weaveworks, said, “Weave GitOps aims to democratize GitOps for Kubernetes, in the same way that GitHub did for Git to accelerate adoption. With our enterprise tier, organisations can use GitOps to deploy and manage their Kubernetes applications and infrastructure securely and reliably.”

Weave GitOps is delivered in tiers, including a free and open source Core and an Enterprise tier. Weave GitOps Core automates the application life cycle for developers and DevOps teams, while Weave GitOps Enterprise brings continuous operations and control for Kubernetes fleets to platform teams and operators.

Bitwarden enhances password management for businesses

Bitwarden, the open source password manager for businesses, has announced a broader set of password management features for enterprises seeking to ensure password security at scale. Admin Password Reset, a new policy feature available to Bitwarden enterprise plan customers, provides designated administrators the ability to reset passwords on end user accounts if employees lose or forget their Bitwarden password.

With the added features, administrators can now seamlessly provision new master passwords or delegate that control to other administrators, along with password policies for complexity, strength, and minimum length. Password reset requests get resolved quickly, end users regain access and maintain continuity of their password management, and companies strengthen overall security for critical tools and assets.

The Admin Password Reset rollout remains consistent with the Bitwarden zero-knowledge encryption model. Bitwarden Enterprise customers have the option to activate Admin Password Reset, allowing for broader continuity of use with a password manager.
