

navigating to `http://localhost:8888`. You will find the output as shown in Figure 5.

Then data can be loaded from the *Load Data -> Local Disk* option, as shown in Figure 6. The example data from the tutorial folder can be chosen.

The following steps can be carried out:

- Data can be parsed based on the input format.
- Time based parsing can be carried out.
- Transform, filter and configuration can be explored.
- The rollout options can be either turned on or off.
- Partition can be carried out by selecting the segment granularity.
- Tune and publish can be carried out.
- The spec can be edited if required. Finally, the data can be submitted.

Each step is explained with an illustrative screenshot in the official documentation at <https://druid.apache.org/docs/latest/tutorials/index.html>.

Querying of the data can be carried out with the following steps:

- Select the *DataSources* tab.
- You can select a particular source and choose *Query* with SQL.

- Next, type this simple query to view the results:

```
SELECT * FROM "Wikipedia"
```

If you are working on a project that involves time series data and a large number of events, Druid is a great way to improve the performance of your app. **END**
