

```
url(r'^$', homepage, name='home'),]
```

The *urls.py* file has all the new URLs that we need for each page, and we have to include them here in this file:

polls/admin.py

```
from polls.models import Question, Choice
admin.site.site_header="surveyEarth Admin"
admin.site.site_title="surveyEarth Admin Page"
admin.site.index_title="Welcome to the surveyEarth Admin Page"
class ChoiceInline(admin.TabularInline):
    model=Choice
    extra = 3
class QuestionAdmin(admin.ModelAdmin):
    fieldsets=[(None,{'fields':['question_text']}),
        ('Date Information',{'fields':['pub_date'],'classes':['collapse']}),]
    inlines=[ChoiceInline]
admin.site.register(Question, QuestionAdmin)
```

The *admin* file is created by default, and we need to add the code here in order to create the questions and answers.

polls/models.py

```
class Question(models.Model):
    question_text=models.CharField(max_length=200)
    pub_date=models.DateTimeField('date published')
    def __str__(self):
        return self.question_text
class Choice(models.Model):
    question=models.ForeignKey(Question, on_delete=models.CASCADE)
    choice_text=models.CharField(max_length=200)
    votes=models.IntegerField(default=0)
    def __str__(self):
        return self.choice_text
```

Each model that we have, such as questions and options, needs to be added to our *models.py* file.

polls/urls.py

```
from . import views
app_name='polls'
urlpatterns=[
    path('', views.index, name='index'),
    path('<int:question_id>', views.detail, name='detail'),
    path('<int:question_id>/results/', views.results,
name='results'),
    path('<int:question_id>/vote/', views.vote, name='vote'),
    path('resultsdata/<str:obj>', views.resultsData,
```

```
name="resultsdata"),
]
polls/views.py
```

```
