

```

try:
    selected_choice = question.choice_set.get(pk=request.
POST['choice'])
except (KeyError, Choice.DoesNotExist):
    return render(request, 'polls/detail.html', {
        'question': question,
        'error_message': "You didn't select a choice.",
    })
else:
    selected_choice.votes += 1
    selected_choice.save()
    return HttpResponseRedirect(reverse('polls:results',
args=(question.id,)))
def resultsData(request, obj):
    votedata = []
    question = Question.objects.get(id=obj)
    votes = question.choice_set.all()
    for i in votes:
        votedata.append({i.choice_text:i.votes})
    print(votedata)

```

Each page to be rendered should be shown as a view, and we need to include it in this file. Basically, each view is what we want the user to see.

The following are all our HTML files for making our website's frontend.

templates/base.html

```

<!DOCTYPE html>
<html lang="en">
<head>
    <meta charset="UTF-8">
    <meta name="viewport" content="width=device-width,
initial-scale=1.0">
    <meta http-equiv="X-UA-Compatible" content="ie=edge">
    <link
        rel="stylesheet"
        href="https://stackpath.bootstrapcdn.com/
bootstrap/4.3.1/css/bootstrap.min.css"
integrity="sha384-ggOyR0iXCbMQv3Xipma34MD+dH/1fQ784/j6cY/
iJTQO0hcW7x93Jv0Rxt2M2Zw1T"
        crossorigin="anonymous"
    />
    <title>surveyEarth {% block title %}{% endblock %}</
title>
</head>
<body>
    {% include 'navbar.html' with brand_name='vote' %}
    <div class="container">
        <div class="row">
            <div class="col-md-6 m-auto">
                {% block content %}{% endblock %}
            </div>
        </div>
    </div>

```

```

</div>
</div>
</body>
</html>

templates/home.html

{% extends 'base.html' %}
{% block content %}
<div style="background-color: #404040; width: 500px; height:
200px; color: white; margin: 20px 50px 100px 50px;">
<h1>Welcome!!</h1>
<br>
<h3>Click on start to start the survey</h3>
<center><a class = "btn btn-success " href="{% url
'polls:index' %}">Start</a></center>
</div>
{% endblock %}

```

Now you can refresh your browser page and your polling application will be running. In case there is a problem, run the following commands:

```

Python3 manage.py makemigration
Python3 manage.py migrate
Python3 manage.py runserver

```

Now refresh your browser and the application should be working well, as shown in Figure 3.

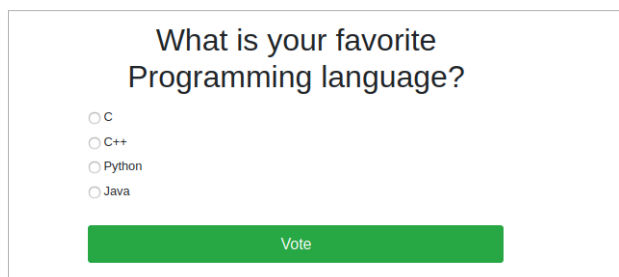

Figure 3: Final look of the project

That's it. If you have done this you have officially developed your first Django project. It's great, isn't it? Do give it a try, and if you have any more doubts or want to explore more in Django, do check out its official documentation. Happy coding!
