

Airbyte offers open source data integration platform to data lakes

Open source data integration platform Airbyte has announced its first data lake integration, allowing AWS users to replicate data from any source to Amazon's Simple Storage Service (S3).

As businesses have data spread across several tools like CRM and marketing, it becomes harder to derive meaningful insights from different locations. So data has to be placed in centralised locations in common formats for analysis.

"Airbyte is moving forward with its mission to commoditise all data integration and will start supporting all the other data lakes. Airbyte is becoming the new *de facto* standard for open source ETL/ELT," said Michel Tricot, co-founder and CEO of Airbyte.

The company announced it is establishing the new standard of moving and consolidating data from different sources to data warehouses, data lakes, or databases in a process referred to as extract, load, and, when desired, transform (ELT). Businesses can create data pipelines from sources such as PostgreSQL, MySQL, Facebook Ads, Salesforce, and Stripe, and connect to destinations that include Redshift, Snowflake, and BigQuery.

Airbyte said it is already fostering a community of more than 2,500 users to build and maintain open source connectors. To date, there are 75 connectors that Airbyte is certifying to ensure they are production ready. This figure should touch 200 by the end of this year.

Arnal Dayaratna, research vice president, software development at IDC, said, "Given their role in designing, building, and executing digital strategies, developers have become indispensable to the modern enterprise. Developers are product designers, product managers, business analysts, builders, strategists, and sales professionals all rolled into one. This expansion of the responsibilities of developers means that developers are critical to the success and growth of enterprises and organisations as measured by their ability to innovate, execute on

strategic and operational plans, and pivot business operations in response to a rapidly changing business landscape."

He added, "Developers should be considered technology buyers because they have a strong influence over purchasing decisions. Between 70 per cent and 79 per cent of developers feel they have either significant

or complete influence over purchasing and procurement decisions, including decisions related to the modernisation of legacy apps, cloud adoption, and cloud vendor selection."

Al Gillen, group vice president, software development and open source at IDC said, "The last year has made crystal clear the value that developers bring to their organisations through software-driven competitive differentiation, and agile development response to changing needs that were unanticipated for many organisations."

Ninety-seven per cent of UK companies use open source software

A report by Open UK, an organisation for the business of open source software, hardware and open data, found that an overwhelming number of companies were using open source software and some were contributing to open source projects.

"The first of its kind, this report makes visible the current business adoption of open source software in the UK and provides a baseline of what will be an annual review – to capture the growth, shifts and changes of open source software use in the UK in the coming years," claimed Jennifer Barth, PhD, founder of consultancy firm Smoothmedia and the leader of the research which led to the report.

"Open source software is no longer a niche term for business and government; it is rapidly becoming the *de facto* method for work today. When it comes to software standards, open source is the way to get it done. Looking at the software industry, many of the biggest businesses are heavily reliant on open source, whether it be cloud vendors, software vendors, healthcare, the financial industry, telecommunications or... the list goes on. Open source software is the foundation for established vendors even when their products are proprietary. It is the toolbox enabling entrepreneurs and start-ups," said Andrew Waffa, a distinguished engineer and senior director of Arm software communities.

The survey findings revealed that open source databases like MySQL, PostgreSQL, and Cassandra are widely used in the UK. The most common types of open source software used are open source software languages, open source software tools, GitHub or other public repositories, open source operating systems, and open source databases.
