

Most used types of open source software (Credit: Open UK)

The development of open source software relies on collaboration and contribution. According to the survey, although 97 per cent of businesses in the survey sample use a type of open source software, a vast majority of respondents (89 per cent) run open source software internally in their business, while approximately two-thirds of respondents (65 per cent) contribute to open source software. The report said that the bulk of the contribution comes from the technology, media and communications sectors.

Meltano spins out of GitLab, raises US\$ 4.2 million in seed funding

GitLab Inc., a company that offers a complete DevOps Platform, has announced the spin-out of Meltano, an open source ELT (Extract, Load, Transform) platform built for the DataOps era. Meltano has also closed US\$ 4.2 million funding led by GV and a number of angel investors, including Ram Shriram; WordPress founder Matt Mullenweg; and Max Beauchemin, creator of Apache Airflow and Superset. As an independent company, Meltano has the opportunity to grow further as an open source company and focus on addressing the needs of the data engineering market starting with enhanced data integration.

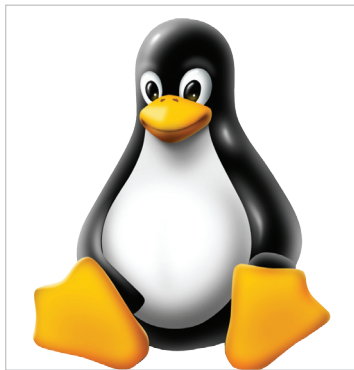

Sid Sijbrandij, co-founder and CEO of GitLab, said, "From its inception, Meltano has operated separately from GitLab's DevOps platform. It started as a tool built for GitLab's data and analytics team, who wanted an end-to-end data platform built around open source components and DevOps principles. With its new seed funding, Meltano, as an independently managed entity, will provide the benefits of open source data integration and DataOps to more organisations."

Douwe Maan, CEO of Meltano, said, "Over the past few years, we have seen a wave of great open source data tools and technologies for data integration, transformation, orchestration, and visualisation. I believe that there is still a significant challenge in integrating these disparate tools, and managing their configuration and deployment consistently across environments. Meltano strives to solve this data workflow problem by bringing these solutions together in a single DataOps-ready project repository that scales with the needs of the organisation. With this seed funding, we will be able to support more tools and make them accessible to more organisations."

Linux Foundation to form Open 3D Foundation

The Linux Foundation has announced an intent to form the Open 3D Foundation to accelerate developer collaboration on 3D game and simulation technology. The Open 3D Foundation will support open source projects that advance capabilities related to 3D graphics, rendering, authoring, and development.

Founding members of the Open 3D Foundation include AccelByte, Adobe, Apocalypse Studios, Audiokinetic, AWS, Backtrace.io, Carbonated, Futurewei, GAMEPOCH, Genvid Technologies, Hadean, HERE Technologies, Huawei, Intel, International Game Developers Association, KitBash3D, Kythera AI, Niantic, Open Robotics, PopcornFX, Red Hat, Rochester Institute of Technology, SideFX, Tafi, TLM Partners and Wargaming. These members are contributing funding and resources to the foundation as the initial governing members.

Under the first project governed by the new foundation, Amazon Web Services, Inc. (AWS) is contributing an updated version of the Amazon Lumberyard game engine as the Open 3D Engine (O3DE), under the permissive Apache 2.0 license. The Open 3D Engine enables developers and content creators to build 3D experiences unencumbered by commercial terms and will provide the support and infrastructure of an open source community through forums, code repositories, and developer events.

Major features of the Open 3D Engine include a new multi-threaded photorealistic renderer, an extensible 3D content editor, a data-driven character animation system, and a node-based visual scripting tool. Developers can build games and new engine features on top of O3DE's component-based architecture, which enables components of the engine to be used together or independently.

Airbyte releases log-based Change Data Capture software

Airbyte has announced the release of its log-based Change Data Capture (CDC) open source software. This enables data stored in MySQL and Postgres databases to be replicated quickly and efficiently anywhere. Airbyte will also add support for Microsoft SQL Server, Oracle Database, MongoDB and DynamoDB. Any authorised database user or administrator can perform database replication without requiring additional work from their IT team.
