

of cloud services. Typically, they are required to provide a transparent view on all cloud service usage patterns and also offer various manual and automated facilities to manage the costs associated with cloud service. They are also required to enable cost management through budgets, alerts and workflows on infrastructure and platform service provisioning.

CSEM, also termed as FinOps, is expected to offer the core benefit of any cloud platform, which is cost management. Cloud service platforms like Microsoft Azure, Amazon (AWS) and Google Cloud Platform (GCP) provide native cloud management facilities like budgets, alerts, cost advisories and workflow management for provisioning.

Apache CloudStack is a highly scalable platform with a very efficient cloud management service where rule based cost management, like usage

limitations and reporting of usage statistics, can be defined. Though explicit CSEM facilities like cost advisory and predictive cost analysis are not explicitly available in the CloudStack platform, it has all the

cloud cost and billing APIs available as RESTful service. Hence, it can be integrated with any third party cloud cost management platform like Densify or Apptio Cloudability for flexible CSEM. **END**
