

YADRO joins the Open Invention Network community

Open Invention Network (OIN), the organisation formed to safeguard open source software (OSS) and the patent non-aggression community, announced that YADRO has joined as a community member.

According to IDC, YADRO provides enterprise storage and high-performance servers in Russia and Eastern Europe.

“High-performance enterprise computing and storage is enabled by Linux and other key open source software projects. The shared innovation generated by the open source community has enabled previously unimaginable scalability and stability. OSS is essential to modern on-premises, hybrid and cloud-based environments,” said Keith Bergelt, CEO of Open Invention Network.

“Open source platforms enable the rapid deployment of advanced computing, storage and communications solutions. We recognise the value in shared innovation, a fundamental characteristic of open source communities,” said Anna Egorova, chief delivery officer at YADRO.

OIN’s community practices patent non-aggression in core Linux and adjacent open source technologies by cross-licensing Linux System patents to one another on a royalty-free basis. Patents owned by Open Invention Network are similarly licensed royalty-free to any organisation that agrees not to assert its patents against the Linux System.

announced the integrations of its data provision with many of these new networks, including chains like Moonriver, Arbitrum, Celo, Shiden and many others.

Yugabyte raises US\$ 188 million to expand into new markets

Yugabyte has raised US\$ 188 million in oversubscribed Series C funding led by Sapphire Ventures in support with Alkeon Capital, Meritech Capital, Wells Fargo Strategic Capital, and others.

The new funding comes seven months after the company raised US\$ 48 million in a Series B-1 round that puts the company’s valuation at more than US\$ 1.3 billion.

Yugabyte’s open source database provides both the Apache Cassandra and

PostgreSQL databases with API compatibility.

“This additional funding will enable us to further grow Yugabyte’s field and engineering teams and fuel the company’s ongoing expansion into new markets around the world,” wrote Bill Cook, CEO of Yugabyte in the company blog.

“We built YugabyteDB to address the growing unmet need for a cloud native transactional RDBMS for modern applications.”

YugabyteDB is an open source distributed SQL database that can run anywhere cloud native applications are deployed, across private, public, hybrid, and multi-cloud environments.

DTC’s open source repository is now available on GitHub

Digital Twin Consortium (DTC) said its open source collaboration initiative is now available to the public on GitHub. An open source collaboration community accelerates the adoption of digital twin-enabling technologies and solutions.

Consortium members and non-members can collaborate on open source projects, code, and collateral and become part of the DTC ecosystem.

“As a consortium, our collective goal is to progress digital twin technology out of the lab and into the marketplace. Digital twins can be difficult to apply across the entire life cycle, where

efficiency is often stifled by data silos and a lack of interoperability. Integration with legacy environments can also be challenging,” said Dan Isaacs, CTO, Digital Twin Consortium.

To contribute to the open source collaboration community, candidates have to complete a project application, which the DTC Technical Advisory Committee reviews. If approved, contributors upload their project or related content to the DTC Open Source Collaboration GitHub site.

Eclipse Foundation launches the Oniro project

The Eclipse Foundation has launched the Oniro project and working group to create an independent implementation of the operating system OpenHarmony.

The OpenHarmony operating system is based on a HarmonyOS created by Huawei. It supports multiple kernels and uses the Linux kernel if a device has a large memory. Huawei, along with Linaro, Seco, Array, NOITechPark and Synesthesia, has been contributing to a continuous integration/continuous delivery (CI/CD) platform that is part of the larger Oniro project.

“Oniro is open source done right,” said Mike Milinkovich, executive director of the Eclipse Foundation. “It represents a unique opportunity to develop and host a next-
