

generation operating system to support the future of mobile, IoT, machine economy, edge and many other markets.”

With the creation of the Oniro project, the Eclipse Foundation aims to strengthen the global technology ecosystem, while bringing a vendor-

neutral, open source OS to the global market.

Discourse fixes critical vulnerability in its forum software

Developers of Discourse, a popular open source forum software, have patched a critical security flaw that could result in an attack on remote code execution (RCE) in vulnerable systems.

The critical bug (CVE-2021-41163), which affects Discourse versions 2.7.8 and earlier, is found to have been triggered through a malicious Amazon

SNS subscription payload. The root cause was identified from a validation bug in the upstream aws-sdk-sns gem, Discourse’s AWS notification webhook handler.

This lack of validation in subscribe_url values makes it vulnerable to RCE through malicious requests.

Huawei donates its open source OS ‘openEuler’

Huawei announced at the Operating System Industry Summit 2021 that it will be joining all partners in the community to formally donate its open source operating system ‘openEuler’ to the OpenAtom Foundation.

Euler is an open source operating system for digital infrastructure that can be deployed in servers, cloud computing, edge computing, embedded and other devices in various forms. Its applications cover IT, CT (communication technology) and OT (operational technology). The openEuler program was initially announced in 2019, with the new openEuler OS launched back in September this year.

“Huawei will donate the complete OpenEuler open source operating system code, brand trademarks, community infrastructure, and other related assets to the OpenAtom Open Source Foundation to build more strong digital infrastructure,” said

Wang Tao, executive director of Huawei and director of the ICT infrastructure business management committee.

Currently, the OpenEuler community has around 10,000 developers, around a hundred special interest groups, and 300 partner companies. This operating system

combines the power of processors, machines, basic software, application software, industry customers, and other partners in the entire industry chain.

Deng Taihua, Huawei’s vice president and president of the computing product line, said that the company will continue to invest in and promote the development of openEuler in five aspects. This includes technological innovation, ecological construction, commercial promotion, open source construction, and talent development.

Alibaba open sources four RISC-V cores

Alibaba has introduced a range of RISC-V processors with the Xuantie family, ranging from the E902 microcontroller class core to the C910 core for servers in data centres. This also includes the Xuantie C906 core found in the Allwinner D1 single-core RISC-V processor.

SETL open sources its PORTL framework

Enterprise blockchain firm SETL is open sourcing its core framework PORTL, in an effort to speed up adoption of blockchain and DLT solutions. PORTL is said to provide a robust, permissioned toolset for financial institutions to build applications that interoperate between existing infrastructures and a range of enterprise ledger technologies including Corda, Besu, Fabric, DAML and SETL’s own high-performance ledger.

The adoption of DLT in financial services has been slow in spite of the tremendous potential the technology has to offer. Many of the reasons lead back to a lack of understanding of secure deployment procedures for banks, where the high levels of IT security that banks expect stands in contrast to the innovation-first approach taken by some blockchain frameworks.

Philippe Morel, SETL CEO said, “The potential of DLT solutions is still significantly underexploited. With our open source and fully interoperable PORTL framework, we hope to contribute to a wider adoption of DLT-based solutions.”

SETL provides institutions with tools they need to take DLT and blockchain into production. To ease integration with existing systems, SETL has adopted Kafka, the open source, high volume event engine as its main backbone for inter-process communication.

“Our use of high capacity and battle-hardened components such as Kafka and Camunda is in line with the technology journey financial institutions are taking. PORTL bridges the gap between ledger innovation and business integration allowing the true benefits of DLT to make the jump from POC to live operation,” Morel added.
