

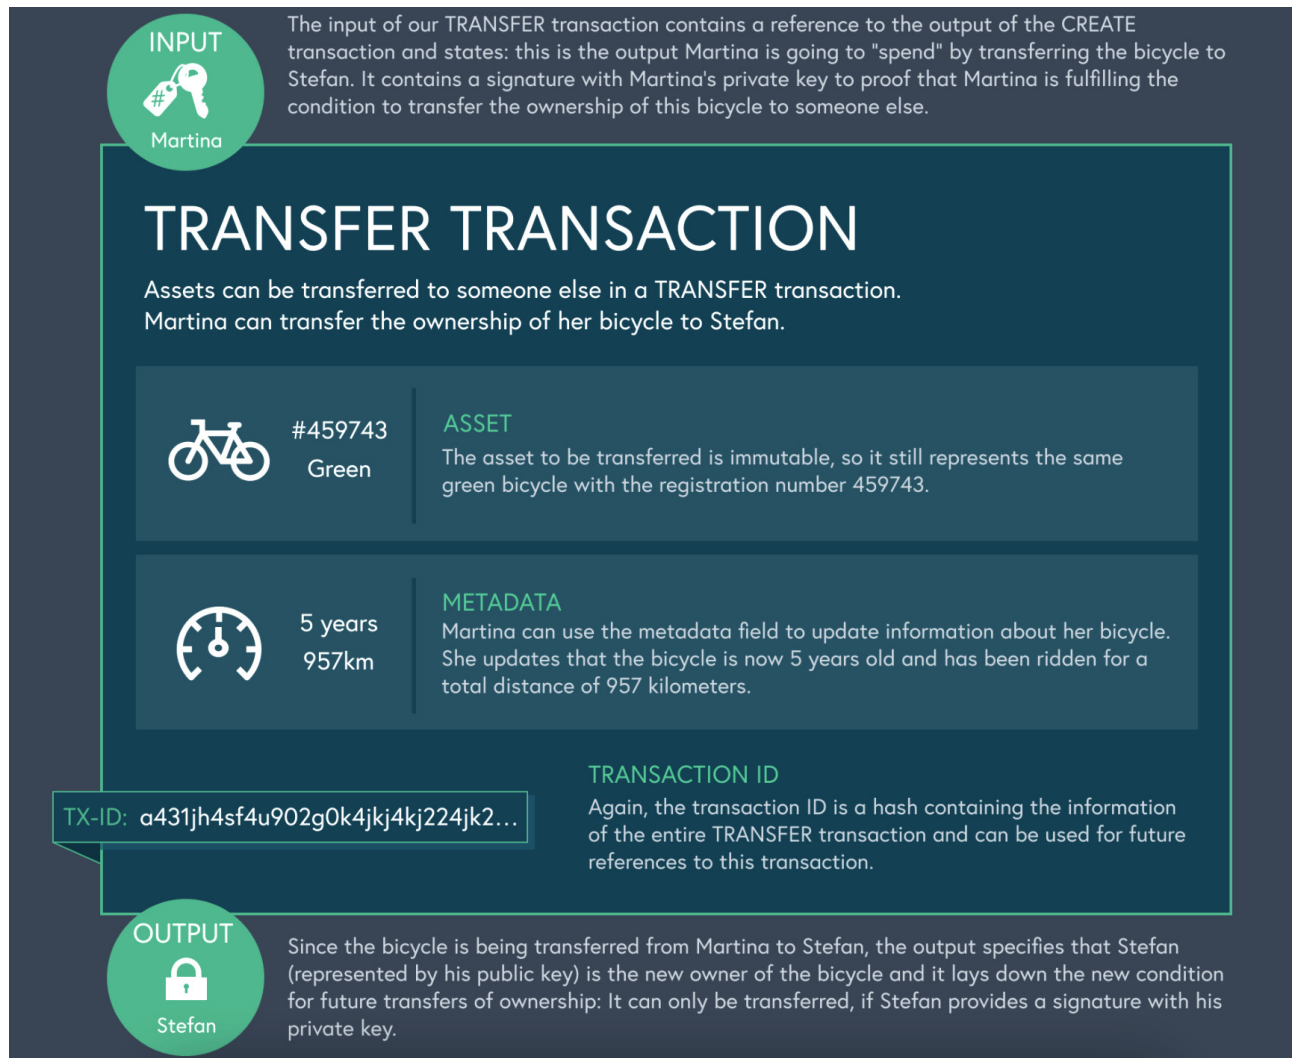

Figure 2: TRANSFER transaction in BigchainDB (Courtesy: BigchainDB)

on your local device, then it can be localhost.

```
bdb_root_url = 'https://localhost:8080'
```

Step 5: Now let us create the painting as an asset and generate it under Mike's ownership.

```
bdb = BigchainDB(bdb_root_url)
painting_asset = {
    'data': {
        'painting': {
            'name': 'New Mona Lisa',
            'painter': 'Mike'
        }
    },
}
```

```
painting_asset_metadata = {
    'date_started': '10/1/2021'
    'date_completed': '12/3/2021'
}
prepared_creation_tx = bdb.transactions.prepare(
    operation='CREATE',
    signers=mike.public_key,
    asset=painting_asset,
    metadata=painting_asset_metadata
)
fulfilled_creation_tx = bdb.transactions.fulfill(
    prepared_creation_tx,
    private_keys=mike.private_key
)
```

Step 6: Finally, we upload the asset as a node into the database.
