

OrientDB: A Flexible and Scalable Multi-Model NoSQL DBMS

The optimal performance of a software application depends on how efficiently the underlying data model is defined. OrientDB is a multi-model NoSQL database management system that combines the strengths of graphs with the flexibility of documents, and is highly scalable. This article introduces various features of OrientDB.

The success of a software application is dependent to a large extent on the manner in which data is represented in it. The underlying data model decides critical application performance measures such as speed. Modern-day database management systems provide excellent features that help to work with data in an optimal manner. NoSQL databases have become an important part of the data analysis ecosystem.

Features of OrientDB

In the past, databases had the ability to support only a single data model. OrientDB can support multiple data models. Its features are listed in Figure 1.

Speed: OrientDB is tailor-made to work at a super speed. The official documentation claims that it can store up to 120,000 records in a second. The speed of OrientDB is excellent for both read and write operations. The usage of RAM is also better. The traversing speed of the tree is not affected majorly by the size of the database, which is an awesome feature to have.

Enterprise level abilities: Though NoSQL databases are very useful, in many scenarios they are adapted as secondary databases. The power of OrientDB lies in the fact that it is both flexible and powerful to function as an operational DBMS.

Zero configuration multi-master architecture: OrientDB provides elastic linear scalability. As it has zero configuration multi-master architecture, it is very well suited for the cloud environment.

Zero delay start: The ability to get started without any delay is an important reason why you should choose OrientDB. As it is built using Java, it can run on all major operating systems without depending on a long list of dependencies.

Multi-language bindings: OrientDB has bindings
