

Malboxes

Malboxes is a utility that builds Windows virtual machines (VMs) without requiring any user intervention. The malware analysis tools and security settings for the VMs are set up for malware investigation. Malboxes can also be referred to as a tool designed to assist in the creation of secure

and rich-featured Windows PCs for malware analysis. Not only can anyone use this tool, it even works with trial versions of Windows if you don't have your own licence. Malboxes creates a virtual machine (VM) template for Windows 10 Enterprise evaluation and then launches a duplicate of it with the current folder shared on the VM's

desktop. It also comes with a set of tools for safe malware analysis built into its virtual machine.

Architecture of Malboxes

Malboxes wraps together the following components:

- A packer configuration
- Windows unattended installation
